

Multi-Agent Optimization

Tutorial at AAMAS'23

Filippo Bistaffa Gauthier Picard Roie Zivan

Some contents adapted from previous tutorials (<http://https://www2.isye.gatech.edu/~fferdinando3/cfp/AAMAS19/>)

Introduction and Motivations

Who are we?

Filippo Bistaffa, PhD

IIIA-CSIC, Barcelona
Expertises: coalition
formation,
parallel computing, shared
mobility

Gauthier Picard, PhD, Hab.

ONERA, the French
Aerospace Lab
Expertises: DCOPs,
self-organization, resource
allocation

Roie Zivan, PhD

Ben Gurion University of the
Negev
Expertises: DCOPs, partial
cooperation

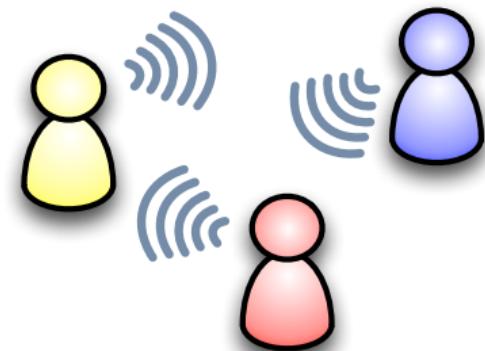

Introduction and Motivations

Multiagent Systems

- **Agent**: An entity that behaves autonomously in the pursuit of goals
- **Multi-agent system**: A system of multiple interacting agents

An agent is...

- **Autonomous**: Is of full control of itself
- **Interactive**: May communicate with other agents
- **Reactive**: Responds to changes in the environment or requests by other agents
- **Proactive**: Takes initiatives to achieve its goals

Introduction and Motivations

Research questions addressed during this tutorial

- How to make collective optimal decisions?
 - ▶ How to model the collective decision?
 - ▶ Which protocols to implement these decisions?

- How to form groups *wrt* to some utility criteria?
 - ▶ How to model the utility of each group?
 - ▶ How to express which groups are feasible or not?

Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

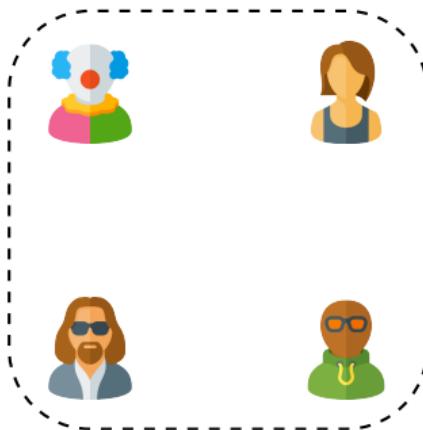

$$A = \{ \text{$$

- $v(\{\text{以人为中心}\}) = 0$
 - $v(\{\text{人}, \text{机器人}\}) = -7$
 - $v(\{\text{人}, \text{机器人}, \text{人}\}) = 3$
 - ...

Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

Set of Agents A

$$A = \{\text{, , , }\}$$

- $v(\{\text{boy, girl}\}) = 0$
 - $v(\{\text{boy, girl, boy}\}) = -7$
 - $v(\{\text{boy, girl}\}) = 3$
 - ...

Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

Set of Agents A

$$A = \{\text{, , , }\}$$

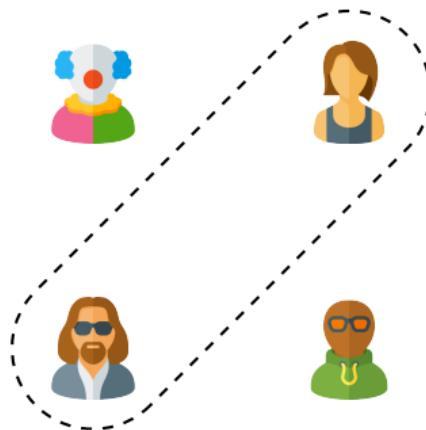

Characteristic Function $v(\cdot)$

- $v(\{\text{Sunglasses, Girl}\}) = 0$
 - $v(\{\text{Girl, Girl, Girl}\}) = -7$
 - $v(\{\text{Sunglasses, Girl, Girl}\}) = 3$
 - ...

Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

Set of Agents A

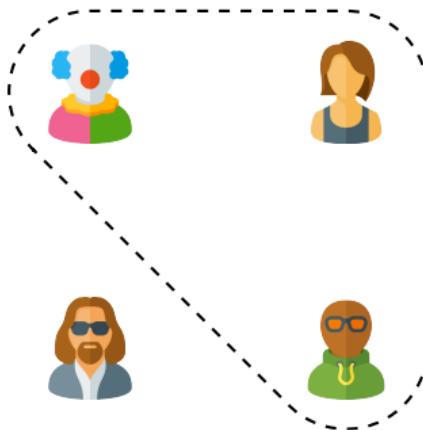

$$A = \{\text{, } \text{, } \text{img alt="Person with short brown hair" data-bbox="318 111 358 130"/}, \text{img alt="Person with glasses" data-bbox="368 111 408 130"/>}\}$$

Characteristic Function $v(\cdot)$

- $v(\{\text{用人}, \text{女}\}) = 0$
 - $v(\{\text{女}, \text{女}, \text{女}\}) = -7$
 - $v(\{\text{用人}, \text{女}, \text{女}\}) = 3$
 - ...

Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

Set of Agents A

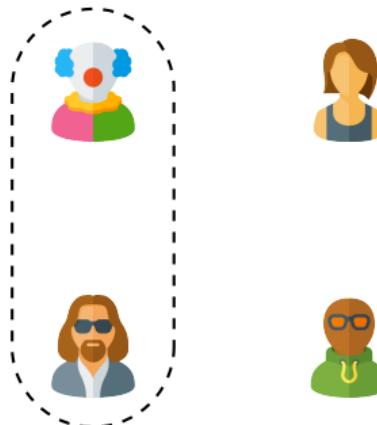

$$A = \{\text{, , , }\}$$

Characteristic Function $v(\cdot)$

- $v(\{\text{以人为中心}\}) = 0$
 - $v(\{\text{人, 植物}\}) = -7$
 - $v(\{\text{人, 植物, 动物}\}) = 3$
 - ...

Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

Set of Agents A

$$A = \{\text{用人}, \text{人}, \text{人}, \text{人}\}$$

Characteristic Function $v(\cdot)$

- $v(\{\text{👤, 👤}\}) = 0$
 - $v(\{\text{👤, 🧑, 🧑}\}) = -7$
 - $v(\{\text{👤, 🧑, 🧑}\}) = 3$
 - ...

Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

Set of Agents A

$$A = \{ \text{, } \text{, } \text{img alt="Avatar of a person with short brown hair and a blue shirt" data-bbox="532 111 562 130"/}, \text{img alt="Avatar of a person with glasses and a green shirt" data-bbox="569 111 599 130"/> } \}$$

Characteristic Function $v(\cdot)$

- $v(\{\text{A, B}\}) = 0$
 - $v(\{\text{A, C, B}\}) = -7$
 - $v(\{\text{A, D, C}\}) = 3$
 - ...

Characteristic Function

[CHALKIADAKIS et al., 2011]

Characteristic Function

The function $v : \mathcal{P}(A) \rightarrow \mathbb{R}$ associates a value to *every coalition* (i.e., subset) of A

Exponential Complexity

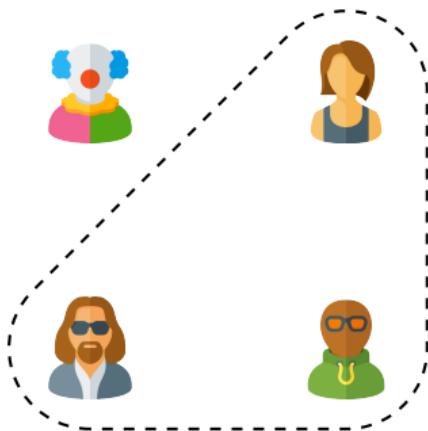

Representing $v(\cdot)$ as a *table* requires an *exponential* number of steps (i.e., $2^{|A|}$)

Mitigate this Complexity

(1) Restrict the set of coalitions or (2) consider $v(\cdot)$ with a specific structure

Cardinality-Restricted CFGs

[SHEHORY and KRAUS, 1998]

Maximum Cardinality k

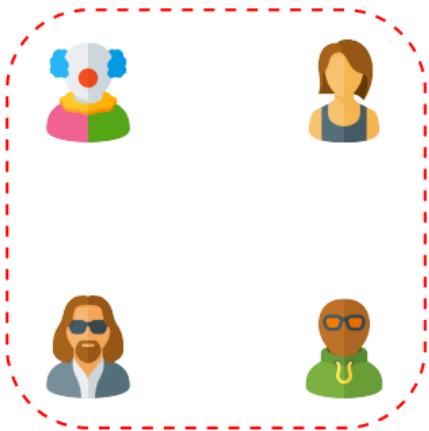

E.g., only coalitions of size ≤ 3 are feasible

Polynomial Number of Coalitions

Total number of coalitions is $\sum_{i=1}^k \binom{|A|}{i} = \mathcal{O}(|A|^k)$,
i.e., *polynomial* wrt $|A|$

Cardinality-Restricted CFGs

[SHEHORY and KRAUS, 1998]

Maximum Cardinality K

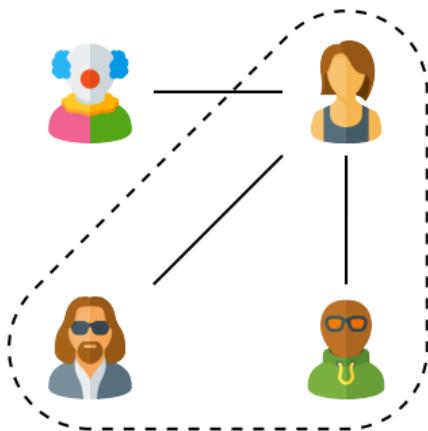

E.g., only coalitions of size ≤ 3 are feasible

Polynomial Number of Coalitions

Total number of coalitions is $\sum_{i=1}^k \binom{|A|}{i} = \mathcal{O}(|A|^k)$,
i.e., *polynomial* wrt $|A|$

Graph-Restricted CFGs

[MYERSON, 1977], [DEMANGE, 2004]

Graph G among Agents

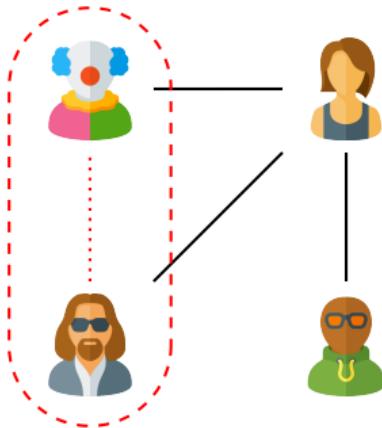

$$G = (\{\text{深厚的}, \text{色彩}, \text{风格}, \text{构图}\}, \{(\text{深厚的}, \text{风格}), (\text{色彩}, \text{风格}), (\text{风格}, \text{构图})\})$$

Connected Subgraphs

A coalition is *feasible* only if it induces a *connected* subgraph of G

Graph-Restricted CFGs

[MYERSON, 1977], [DEMANGE, 2004]

Graph G among Agents

$$G = (\{\text{深厚的}, \text{色彩}, \text{风格}, \text{构图}\}, \{(\text{深厚的}, \text{风格}), (\text{色彩}, \text{风格}), (\text{风格}, \text{构图})\})$$

Connected Subgraphs

A coalition is *feasible* only if it induces a *connected* subgraph of G

Real-World Example: Social Ridesharing

[BISTAFFA et al., 2017b]

Social Ridesharing

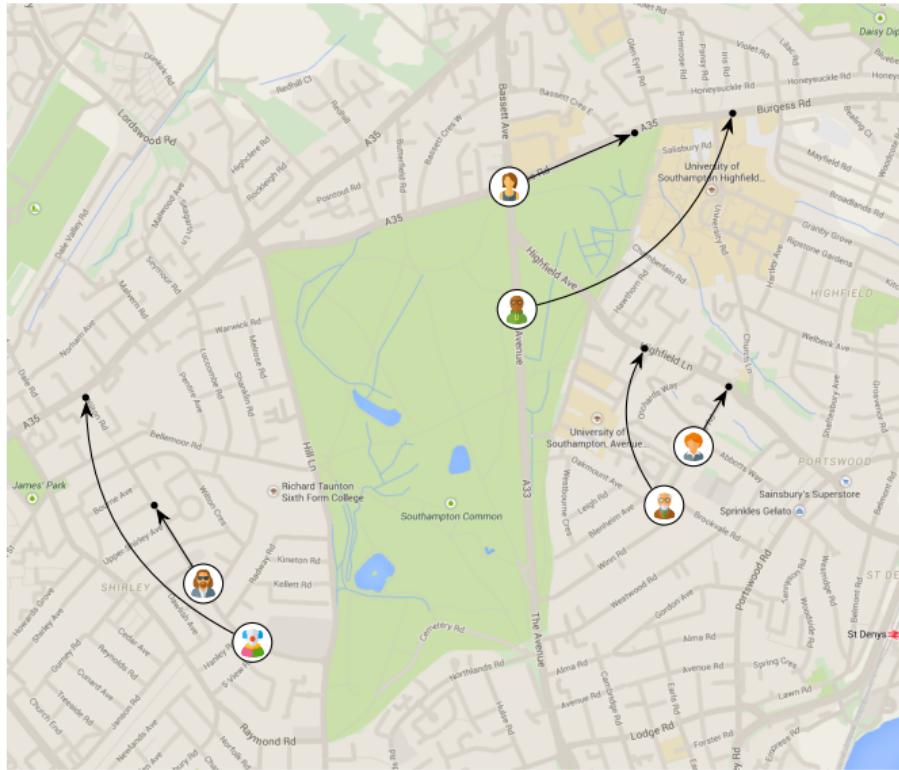

Arrange *cost-effective* shared cars among agents connected by a *social network*

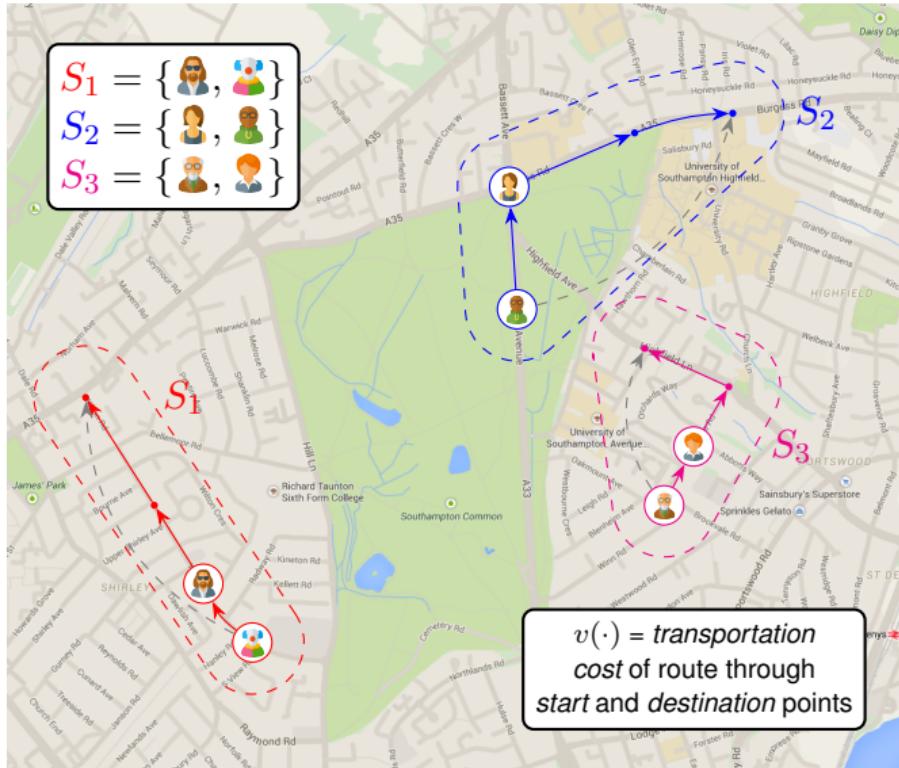

Cardinality-Based Constraints

Cars (i.e., coalitions) can contain *up to 5 passengers*

Graph-Based Constraints

We only form coalitions among “*friends of friends*” (connected subgraph)

CFSS Algorithm

- Builds a *Binary Decision Diagram* (BDD) by **contracting** (or **not**) an edge at each step
- Each coalition structure (i.e., partition of A) is represented *only once* in the BDD
- The optimal coalition structure is computed by doing a *depth-first* traversal of the BDD

Pros

Approximate algorithm with quality guarantees if used in conjunction with *Branch-and-Bound*

Cons

Performance depends on the assumption that $v(\cdot)$ can be expressed in *closed-form*

CSG Approaches based on Search

CSG Approaches based on Integer Linear Programming

Background on Integer Linear Programming

Weighted Knapsack Problem

We want to fill our knapsack (capacity = c) with the goal of maximizing the total value

What is the Optimal Subset of Object for $c = 5$?

- A** Pick  (weight = 1) $\rightarrow 1$
- B** Pick  (weight = 2) $\rightarrow 4$
- C** Pick  (weight = 4) $\rightarrow 3$
- D** Pick  (weight = 5) $\rightarrow 9$
- E** Pick  (weight = 3) $\rightarrow 6$

- $w(\text{apple}) = 1, v(\text{apple}) = 1$
- $w(\text{diamond}) = 2, v(\text{diamond}) = 4$
- $w(\text{ring}) = 4, v(\text{ring}) = 3$
- $w(\text{crown}) = 6, v(\text{crown}) = 1$
- $w(\text{laptop}) = 3, v(\text{laptop}) = 6$

CSG Approaches based on Integer Linear Programming

Background on Integer Linear Programming

Our Ingredients

- Let x_A, x_B, x_C, x_D, x_E be binary decision variables (either pick the object or not)
- Objective function: maximize the value of selected objects
- Constraint: do not exceed the knapsack capacity

Integer Linear Programming (ILP) Formulation

maximize $1 \cdot x_A + 4 \cdot x_B + 3 \cdot x_C + 9 \cdot x_D + 6 \cdot x_E$ (Values of selected objects)

subject to $1 \cdot x_A + 2 \cdot x_B + 4 \cdot x_C + 5 \cdot x_D + 3 \cdot x_E \leq 5$ (Capacity constraint)

$x_A, x_B, x_C, x_D, x_E \in \{0, 1\}$ (Binary decision variables)

CSG Approaches based on Integer Linear Programming

[RAHWAN et al., 2015]

- Given A and a set \mathcal{S} of *coalitions* (i.e., subsets) of A , let M be a $|A| \times |\mathcal{S}|$ matrix
- $M_{iS} = 1$ if and only if agent $a \in A$ is part of coalition $S \in \mathcal{S}$, $M_{iS} = 0$ otherwise

The diagram illustrates a set of agents and their possible coalitions. On the left, seven agents are shown, each with a unique combination of colored dots (blue, green, red, yellow) on their head. Brackets group them into coalitions: {1, 2}, {3, 4}, {5}, {6, 7}, {1, 3, 5}, {2, 4, 6}, {1, 2, 4, 6}, and {1, 2, 3, 4, 5, 6, 7}. On the right, three icons represent the columns of the matrix: a person with glasses, a person with a phone, and a person with a laptop. Below this, the matrix M is defined as:

$$M = \begin{bmatrix} 1 & 0 & 0 & 1 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 1 \\ 0 & 0 & 1 & 0 & 1 & 1 & 1 \end{bmatrix}$$

CSG Approaches based on Integer Linear Programming

[RAHWAN et al., 2015]

Objective of Coalition Structure Generation

Compute the *partition* of A that *maximizes* the sum of the corresponding values

ILP Formulation for Coalition Structure Generation

$$\text{maximize} \quad \sum_{S \in \mathcal{S}} v(S) \cdot x_S \quad \text{(Value of each selected coalition)}$$

$$\text{subject to} \quad \sum_{S \in \mathcal{S}} M_{iS} \cdot x_S = 1 \quad \forall i \in A \quad \text{(Each agent exactly in *one* coalition)}$$

CSG Approaches based on Integer Linear Programming

[RAHWAN et al., 2015]

Solving Integer Linear Programs

ILPs can be solved with state-of-the-art solvers like CPLEX (very mature technology)

Pros

Does not require any assumption on $v(\cdot)$ (very general approach)

Cons

- Memory requirements can become unmanageable for more than 20–30 agents
- Difficult to directly exploit the structure of the problem (i.e., graph)

CSG Approaches based on Integer Linear Programming

[RAHWAN et al., 2015]

CSG as a COP

[BISTAFFA and FARINELLI, 2018]

Graph-Restricted CFG Example

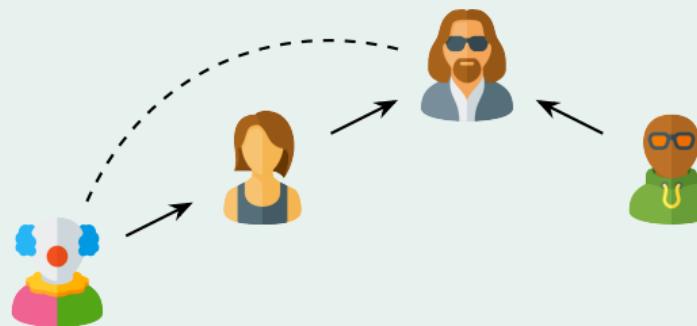

Pseudotree among Agents (Hierarchy)

Adjacent agents in the graph fall in the same branch of the tree (e.g., and

CSG as a COP

[BISTAFFA and FARINELLI, 2018]

Graph-Restricted CFG Example

Pseudotree among Agents (Hierarchy)

Adjacent agents in the graph fall in the same branch of the tree (e.g., and)

CSG as a COP

[BISTAFFA and FARINELLI, 2018]

Challenge

How can we exploit the structure (i.e., hierarchy among agents)?

Main Idea

- Each coalition (i.e., decision variable) is “controlled” by the highest agent
- “Delegate” the formation of coalitions to descendants by means of *required* variables

CSG as a COP

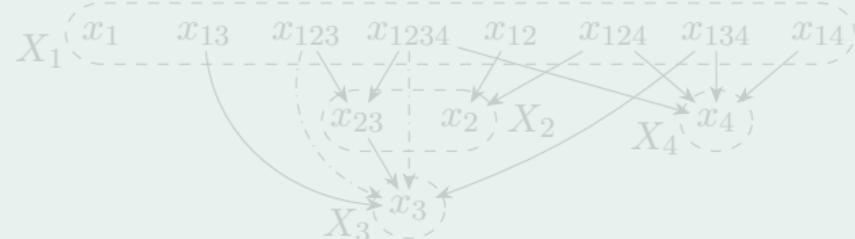

[BISTAFFA and FARINELLI, 2018]

- Each coalition (i.e., decision variable) is “controlled” by the highest agent
- “Delegate” the formation of coalitions to descendants by means of *required* variables

CSG as a COP

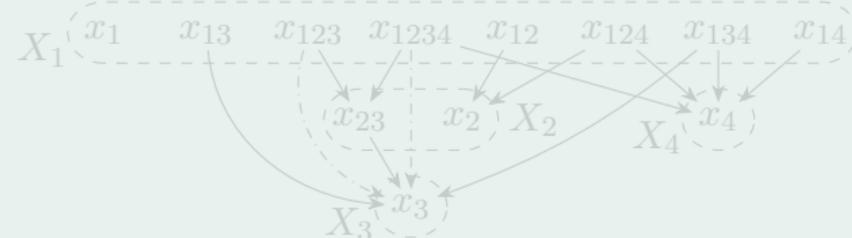

[BISTAFFA and FARINELLI, 2018]

Required Variables

- Any two variables that require the same variable *cannot* be enabled simultaneously
- As a result *no overlapping variables* are activated *at the same time*

Number of Constraints

- Naive COP: $\binom{\text{\# coalitions}}{2}$
- This approach: linear *wrt* the number of agents

Open Question

Can we make this COP a Distributed COP (DCOP)?

CSG as a COP

[BISTAFFA and FARINELLI, 2018]

Introduction and Motivations

Coalition Formation on MAS

Characteristic Function Games

Coalition Structure Generation

Induced Subgraph Games

Distributed Constraint Optimization

Real-World Applications

Conclusion and Wrap-up

Characteristic Function

[CHALKIADAKIS et al., 2011]

Characteristic Function

The function $v : \mathcal{P}(A) \rightarrow \mathbb{R}$ associates a value to *every coalition* (i.e., subset) of A

Exponential Complexity

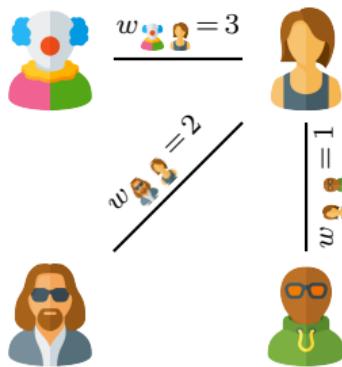

Representing $v(\cdot)$ as a *table* requires an *exponential* number of steps (i.e., $2^{|A|}$)

Mitigate this Complexity

(1) *Restrict* the set of coalitions or (2) consider $v(\cdot)$ with a specific *structure*

Induced Subgraph Games (ISGs)

[DENG and PAPADIMITRIOU, 1994]

Weighted Graph G among Agents

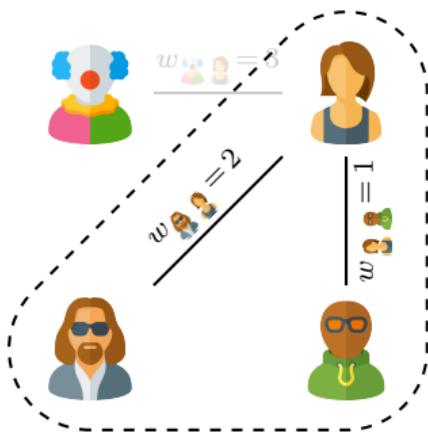

$$G_w = (\{ \text{Agent 1}, \text{Agent 2}, \text{Agent 3}, \text{Agent 4} \}, \{ (\underbrace{\text{Agent 1}, \text{Agent 2}}_2), (\underbrace{\text{Agent 1}, \text{Agent 3}}_3), (\underbrace{\text{Agent 2}, \text{Agent 3}}_1) \})$$

Value is the Sum of Induced Edges

$$v(\{ \text{Agent 1}, \text{Agent 2}, \text{Agent 3} \}) = 2 + 1 = 3$$

Induced Subgraph Games (ISGs)

[DENG and PAPADIMITRIOU, 1994]

Weighted Graph G among Agents

$$G_w = (\{ \text{blue}, \text{pink}, \text{orange}, \text{green} \}, \{ (\underbrace{\text{blue}, \text{orange}}_2), (\underbrace{\text{pink}, \text{orange}}_3), (\underbrace{\text{blue}, \text{green}}_1) \})$$

Value is the Sum of Induced Edges

$$v(\{ \text{blue}, \text{orange}, \text{green} \}) = 2 + 1 = 3$$

Induced Subgraph Games (ISGs)

[CHALKIADAKIS et al., 2011]

Succinct Game Representation

The characteristic function is *entirely* represented by the weighted graph G_w

Computational Advantages

CSG on ISGs can be treated as a *graph clustering* problem (“easier” than CSG)

Limited Representation Power

Not every characteristic function game can be *perfectly* represented as an ISG

Induced Subgraph Games (ISGs)

[CHALKIADAKIS et al., 2011]

Succinct Game Representation

The characteristic function is *entirely* represented by the weighted graph G_w

Computational Advantages

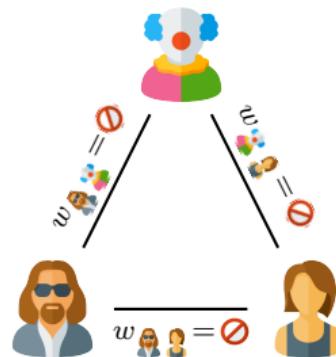

CSG on ISGs can be treated as a *graph clustering* problem (“easier” than CSG)

Limited Representation Power

Not every characteristic function game can be *perfectly* represented as an ISG

Induced Subgraph Games (ISGs)

[CHALKIADAKIS et al., 2011]

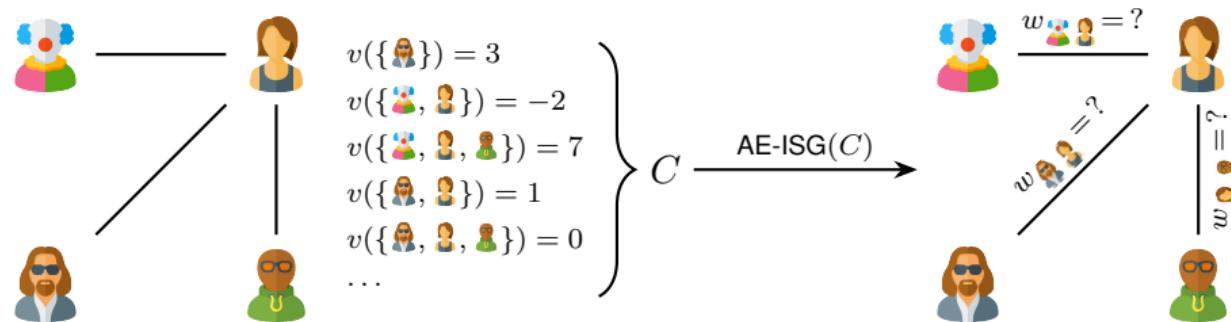

$$v(S) = \begin{cases} 0, & \text{if } |S| = 1, \\ 1, & \text{if } |S| = 2, \\ 6, & \text{if } |S| = 3. \end{cases}$$

Can We Approximate a CFG as an ISG?

[BISTAFFA et al., 2022]

Approximately Equivalent ISG (AE-ISG)

Given a CFG C , compute the ISG that *best approximates* C , namely $\text{AE-ISG}(C)$

AE-ISG as Norm Approximation (ℓ_p Linear Regression)

[BISTAFFA et al., 2022]

minimise $\underbrace{\|Mw - v\|_p}_{\text{residuals}}$

$$M = \begin{bmatrix} \vdots & \vdots & \vdots \\ 0 & 1 & 1 \\ 1 & 0 & 0 \\ 1 & 0 & 1 \\ \vdots & \vdots & \vdots \end{bmatrix} \quad v = \begin{bmatrix} v(\{\text{👤, 🧑, 🧑}\}) \\ v(\{\text{👤, 🧑}\}) \\ v(\{\text{👤, 🧑, 🧑}\}) \\ \vdots \end{bmatrix}$$

AE-ISG as Norm Approximation (ℓ_p Linear Regression)

[BISTAFFA et al., 2022]

$$\text{minimise} \quad \|\underbrace{Mw - v}_{\text{residuals}}\|_p$$

Residual Vector

The *residual vector* $r = Mw - v$ is the vector of *differences* between *approximated* coalitional values (i.e., Mw) and *original* coalitional values (i.e., v)

Constrained Norm Approximation

Some coalitions (singletons) can be represented *exactly* via additional constraints

AE-ISG as Norm Approximation (ℓ_p Linear Regression)

[BISTAFFA et al., 2022]

Size of AE-ISG Model

Building M and v requires to go through the set of coalitional values (obviously)

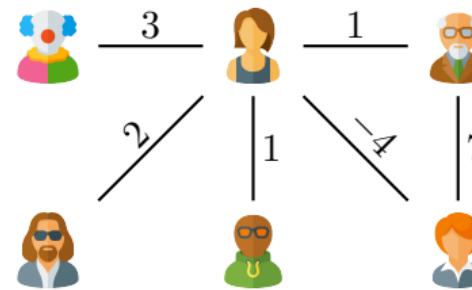

Computational Complexity

If the set of feasible coalitions is *polynomial* (e.g., ridesharing), computing $\text{AE-ISG}(C)$ has a *manageable* complexity, depending on the norm ℓ_p :

- $\ell_1/\ell_\infty \rightarrow$ Linear Programming (exact, CPU)
- $\ell_2 \rightarrow$ Least Squares (exact/analytical, GPU)
- $\ell_{>2} \rightarrow$ Iteratively Reweighted Least Squares (numerical)

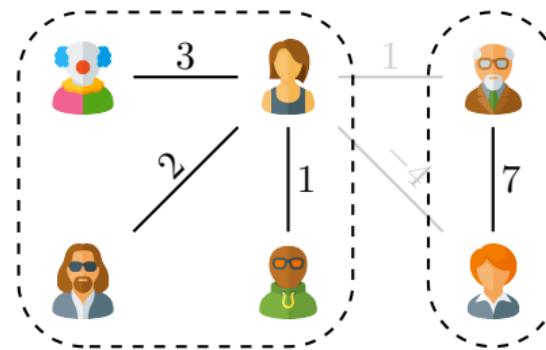

CSG on ISGs as Graph Clustering

[BISTAFFA et al., 2022]

CSG on ISGs as Graph Clustering

[BISTAFFA et al., 2022]

CSG on ISGs Optimisation Objective

Maximise sum of of clusters' internal weights (namely, coverage measure)

ILP for Optimal Graph Clustering (KGC)

[BISTAFFA et al., 2022]

$X_{ij} = 1 \rightarrow$ edge $\{i, j\}$ is “activated” (i and j are in the same cluster)

$$\text{maximise} \quad \sum_{i, j \in A} w_{ij} \cdot X_{ij} \quad (\text{Coverage objective function})$$

$$\text{subject to } \forall i, j, z \in A : \begin{cases} X_{ij} + X_{jz} - 2 \cdot X_{iz} \leq 1 \\ X_{iz} + X_{ij} - 2 \cdot X_{jz} \leq 1 \\ X_{jz} + X_{iz} - 2 \cdot X_{ij} \leq 1 \end{cases} \quad (\text{Transitivity})$$

$$\forall i \in A : \sum_{j \in A} X_{ij} \leq k \quad (\text{Cardinality constraint})$$

Theoretical Quality Guarantees

[BISTAFFA et al., 2022]

KGC computes the value of the optimal CSG solution for the *approximated game AE-ISG(C)*, namely $V(CS_{AE}^*)$

What about the value of the optimal CSG solution for the *original game C*, namely $V(CS_C^*)$?

We proposed a way to compute B_r , such that $V(CS_C^*) - V(CS_{AE}^*) \leq B_r$

DCOP Algorithms

See [FIORETTA et al., 2018]

DCOP Algorithms

See [FIORETTA et al., 2018]

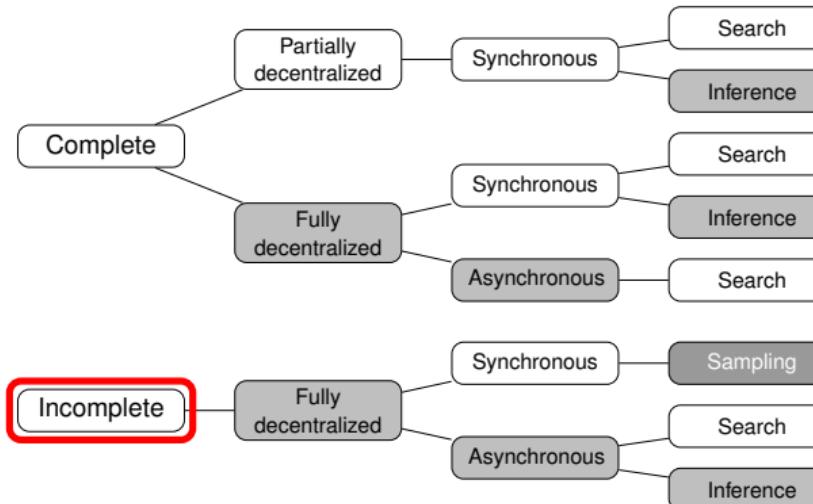

Important metrics

- Agent complexity
- Network loads
- Message size

DCOP Algorithms

See [FIORETTA et al., 2018]

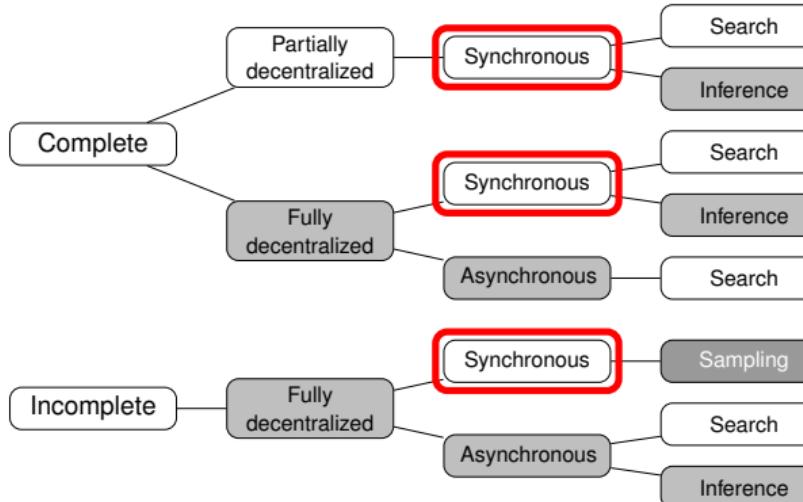

Important metrics

- Agent complexity
- Network loads
- Message size
- Anytime
- Quality guarantees
- Execution time vs. solution quality

DCOP Algorithms

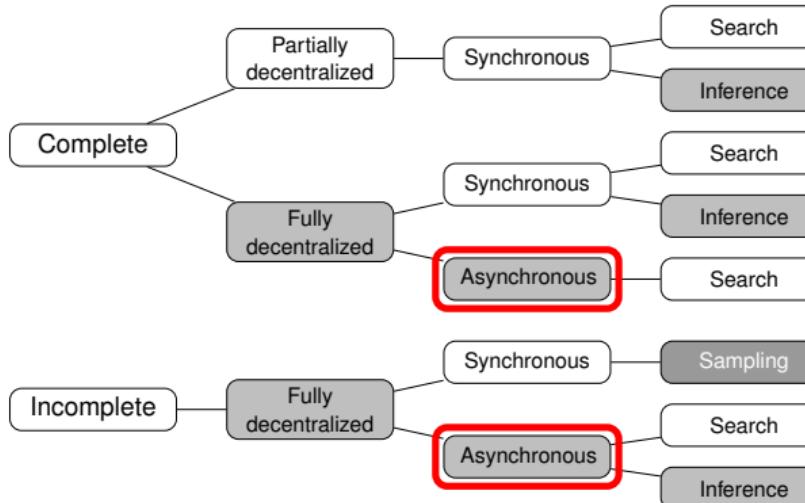

See [FIORETTA et al., 2018]

- Systematic process, divided in steps
- Each agent waits for particular messages before acting
- Consistent view of the search process
- Typically, increases idle-time

DCOP Algorithms

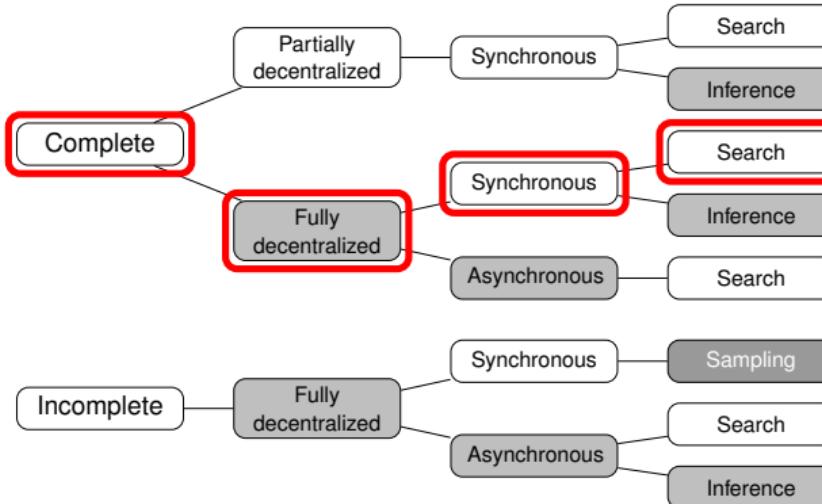

See [FIORETTA et al., 2018]

- Decision based on agents' local state
- Agents' actions do not depend on sequence of received messages
- Minimizes idle-time
- No guarantees on validity of local views

DCOP Algorithms

See [FIORETTA et al., 2018]

How do we solve this distributedly?

Synchronous Branch-and-Bound (SBB)

[HIRAYAMA and Yokoo, 1997]

- Agents operate on a complete ordering
- Agents exchange CPA messages containing partial assignments
- When a solution is found, its solution cost as an UB is broadcasted to all agents
- The UB is used for branch pruning

Complete ordering

Distributed Local Search

[MAHESWARAN et al., 2004; ZHANG et al., 2003]

Local Search Algorithms

- DSA: Distributed Stochastic Search [ZHANG et al., 2005]
- MGM: Maximum Gain Messages Algorithm [MAHESWARAN et al., 2004]
- Note: we now maximize utilities
- Every agent individually decides whether to change its value or not
- Decision involves
 - ▶ knowing neighbors' values
 - ▶ calculation of utility gain by changing values
 - ▶ probabilities

x_i	x_j	(A, B)	(B, C)
red	red	5	5
red	green	5	0
green	red	0	0
green	green	8	8

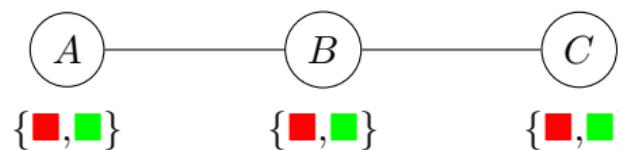

DSA Algorithm

[ZHANG et al., 2005]

- All agents execute the following
 - ▶ Randomly choose a value
 - ▶ while (termination is not met)
 - ▶ if (a new value is assigned): send the new value to neighbors
 - ▶ collect neighbors' new values if any
 - ▶ select and assign the next value based on assignment rule

Conclusion and Wrap-up

Shared Mobility as (Online) Coalition Structure Generation

[BISTAFFA et al., 2019]

What is Shared Mobility for Us?

Arrange *shared rides* (coalitions) among users that submit *real-time* requests, with the objective of *maximizing* a given *objective function*

Shared Mobility as (Online) Coalition Structure Generation

[ibid.]

Our Task

At each time step, arrange a (possibly empty) set of non-overlapping feasible cars among the requests currently active in the system

Shared Mobility as (Online) Coalition Structure Generation

[ibid.]

Our Task

At each time step, arrange a (possibly empty) set of non-overlapping feasible cars among the requests currently active in the system

Our Objective Function

Maximize environmental benefits  and quality of service 

Shared Mobility as (Online) Coalition Structure Generation

[ibid.]

Our Task

At each time step, arrange a (possibly empty) set of non-overlapping feasible cars among the requests currently active in the system

Our Objective Function

Maximize environmental benefits  and quality of service 

Our Case Study [BISTAFFA et al., 2019]

Densely populated areas (e.g., Manhattan) with request rate of 400 reqs/minute

Input of the Online CSG Problem

[BISTAFFA et al., 2019]

Incoming Requests

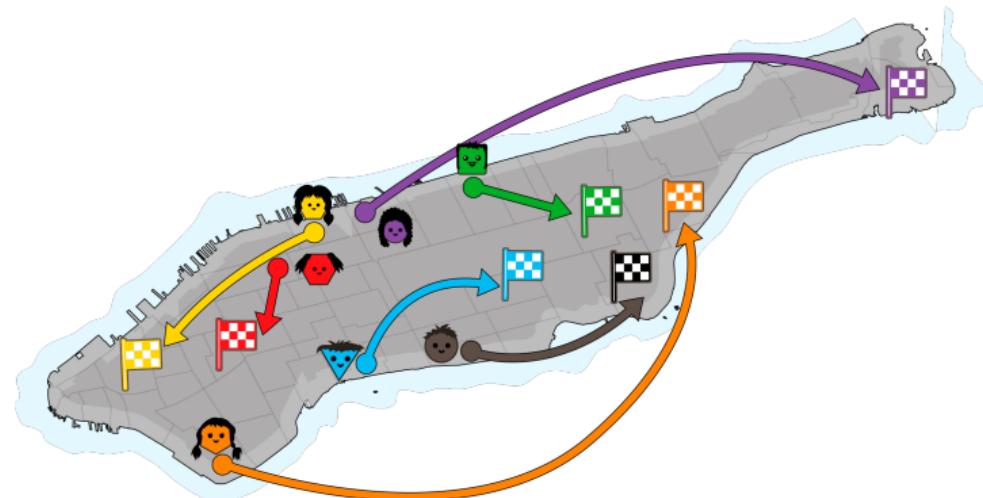

“I just issued a trip request”

Waiting Trip Requests

“I am waiting to share my ride”

Input of the Online CSG Problem

[BISTAFFA et al., 2019]

Example of a Shared Mobility Request

“I want to go from point i to point j , and I am willing to wait δ minutes to be picked up by somebody ($d = \text{false}$) / before I leave with *my own car* ($d = \text{true}$)”

- $r = \langle i, j, d, \delta \rangle$ (A request is a tuple r)
- $r \in R_t$ (The system receives a set R_t of requests at each time step t)
- $\langle R_1, \dots, R_t, \dots, R_h \rangle$ (Sequence of inputs over a time horizon h)
- The input sequence is *not known a priori* (Online optimization problem)

Input of the Online CSG Problem

[BISTAFFA et al., 2019]

Example of a Shared Mobility Request

“I want to go from point i to point j , and I am willing to wait δ minutes to be picked up by somebody ($d = \text{false}$) / before I leave with *my own car* ($d = \text{true}$)”

Value $v(S)$ of a Coalition S

[BISTAFFA et al., 2019]

- The *value* (utility) of a coalition S is defined as:

$$v(S) = \overbrace{\rho_{\text{CO}_2} \cdot E_{\text{CO}_2}(S) + \rho_{\text{noise}} \cdot E_{\text{noise}}(S) + \rho_{\text{traffic}} \cdot E_{\text{traffic}}(S)}^{\text{environmental benefits}} + \overbrace{\rho_{\text{QoS}} \cdot Q(S)}^{\text{quality of service}}$$

- $|S| \leq k$ (Maximum cardinality constraint)

$$F(S) = |S| \leq k \wedge \dots$$

- $\mathcal{F}(R) = \{S \in 2^R \mid F(S)\}$ (Set of feasible coalitions from a set R of requests)

Value $v(S)$ of a Coalition S

[BISTAFFA et al., 2019]

- The *value* (utility) of a coalition S is defined as:

$$v(S) = \overbrace{\rho_{\text{CO}_2} \cdot E_{\text{CO}_2}(S) + \rho_{\text{noise}} \cdot E_{\text{noise}}(S) + \rho_{\text{traffic}} \cdot E_{\text{traffic}}(S)}^{\text{environmental benefits}} + \overbrace{\rho_{\text{QoS}} \cdot Q(S)}^{\text{quality of service}}$$

- $|S| \leq k$ (Maximum cardinality constraint)

$$F(S) = |S| \leq k \wedge \dots$$

- $\mathcal{F}(R) = \{S \in 2^R \mid F(S)\}$ (Set of feasible coalitions from a set R of requests)

Value $v(S)$ of a Coalition S

[BISTAFFA et al., 2019]

- The *value* (utility) of a coalition S is defined as:

$$v(S) = \overbrace{\rho_{\text{CO}_2} \cdot E_{\text{CO}_2}(S) + \rho_{\text{noise}} \cdot E_{\text{noise}}(S) + \rho_{\text{traffic}} \cdot E_{\text{traffic}}(S)}^{\text{environmental benefits}} + \overbrace{\rho_{\text{QoS}} \cdot Q(S)}^{\text{quality of service}}$$

- $|S| \leq k$ (Maximum cardinality constraint)

$$F(S) = |S| \leq k \wedge \dots$$

- $\mathcal{F}(R) = \{S \in 2^R \mid F(S)\}$ (Set of feasible coalitions from a set R of requests)

Curse of Dimensionality

[BISTAFFA et al., 2019]

- Recall that $\mathcal{F}(R) = \{S \in 2^R \mid F(S)\}$
- With $|S| \leq k$, $|\mathcal{F}(R)| \leq \sum_{i=1}^k \binom{|R|}{i}$, i.e., $\mathcal{O}(|R|^k)$ (Polynomial complexity)
- In practice, $|R_t|$ can be as high as 400 (Request rate in NY taxi dataset)

Scalability Problem

Enumerating all coalitions in $\mathcal{F}(R)$ is impractical, especially in realistic application scenarios with *very limited time budget* for the solution

Our Solution

Consider a restricted set $\hat{\mathcal{F}}(R)$ of *good candidate coalitions* instead of $\mathcal{F}(R)$

Curse of Dimensionality

[BISTAFFA et al., 2019]

- Recall that $\mathcal{F}(R) = \{S \in 2^R \mid F(S)\}$

Coalition Formation on MAS

Distributed Constraint Optimization

Real-World Applications

Shared Mobility

Collective Energy Purchasing

Self-configuration of IoT Devices

Observation Scheduling in Multi-Owner Constellations

Conclusion and Wrap-up

Collective Energy Purchasing

[FARINELLI et al., 2013]

Collective Energy Purchasing Scenario

- Each agent has an energy consumption profile
- Customers form coalitions to buy energy at reduced tariffs from two different markets:
 - ▶ *Spot market*: a short-term market intended for smaller amounts of energy
 - ▶ *Forward market*: a long-term market to buy more energy at cheaper prices

Collective Energy Purchasing

[FARINELLI et al., 2013]

Collective Energy Purchasing Scenario

- Each agent has an energy consumption profile
- Customers form coalitions to buy energy at reduced tariffs from two different markets:
 - ▶ *Spot market*: a short-term market intended for smaller amounts of energy
 - ▶ *Forward market*: a long-term market to buy more energy at cheaper prices

Collective Energy Purchasing

[FARINELLI et al., 2013]

Collective Energy Purchasing Scenario

- Each agent has an energy consumption profile
- Customers form coalitions to buy energy at reduced tariffs from two different markets:

 - ▶ *Forward market*: a long-term market to buy more energy at cheaper prices

Collective Energy Purchasing

[FARINELLI et al., 2013]

Profile Merging

- Peaks in energy profiles require the use of *expensive, carbon-intensive*, peaking plant generators, resulting in higher consumers electricity bill
- A *flattened* profile results in a more efficient grid, with *lower carbon emissions* and *lower prices* for consumers

Example

Value $v(S)$ of a Coalition S

[BISTAFFA et al., 2017a]

- The *value* (utility) of a coalition S is defined as:

$$v(S) = \underbrace{\sum_{t=1}^T q_S^t(S) \cdot p_S}_{\text{Spot market}} + \underbrace{T \cdot q_F(S) \cdot p_F}_{\text{Forward market}} - \underbrace{\kappa(S)}_{\text{Coordination cost}}$$

Purchased energy “value”

Coordination cost

Spot market

Forward market

- $q_S^t(S)$: energy purchased from spot market at time t
- $q_F(S)$: total energy purchased from forward market
- p_S : spot market energy price
- p_F : forward market energy price

Value $v(S)$ of a Coalition S

[BISTAFFA et al., 2017a]

- The *value* (utility) of a coalition S is defined as:

$$v(S) = \underbrace{\sum_{t=1}^T q_S^t(S) \cdot p_S}_{\text{Spot market}} + \underbrace{T \cdot q_F(S) \cdot p_F}_{\text{Forward market}} - \kappa(S)$$

Superadditive ($v^+(S)$) Subadditive ($v^-(S)$)

- $q_S^t(S)$: energy purchased from spot market at time t
- $q_F(S)$: total energy purchased from forward market
- p_S : spot market energy price
- p_F : forward market energy price

$m + a$ Characteristic Functions

[BISTAFFA et al., 2017a]

$m + a$ Characteristic Function

- $m + a =$ Superadditive function + subadditive function
 - ▶ Superadditive: $v(S_1 \cup S_2) > v(S_1) + v(S_2)$
 - ▶ Subadditive: $v(S_1 \cup S_2) < v(S_1) + v(S_2)$

Open Question

Is the characteristic function of shared mobility $m + a$?

$m + a$ Characteristic Functions

Real-World Applications

Shared Mobility

Collective Energy Purchasing

Self-configuration of IoT Devices

Observation Scheduling in Multi-Owner Constellations

Conclusion and Wrap-up

SECP model

Smart Environment Configuration Problem [RUST et al., 2016]

- Example of applying DCOPs to a "real" problem
 - Coordinate objects in the building
 - Model
 - ▶ objects
 - ▶ relations between objects and environment
 - ▶ user objectives and requirements
 - Formulate the problem as an optimization problem

SECP model

Smart Environment Configuration Problem [RUST et al., 2016]

Focus on smart lighting use cases

- **Objects:** anything that can produce light: light bulbs, windows with rolling shutter, etc.
- **User preferences:** having a predefined luminosity level in a room, under some conditions
- **Energy efficiency**

Linking objects and user preferences:

- How to model the luminosity in a room ? **variable**
- How to model the dependency between the light sources and the luminosity ? **function / constraint**

SECP model

Example application to ambient intelligence scenario

■ Actuators

- ▶ Connected light bulbs, TV, Rolling shutters, ...

■ Sensors

- ▶ Presence detector, Luminosity Sensor, etc.

■ Physical Dependency Models

- ▶ E.g. Living-room light model

■ User Preferences

- ▶ Expressed as rules :

IF	presence_living_room	=	1
AND	light_sensor_living_room	<	60
THEN	light_level_living_room	←	60
AND	shutter_living_room	←	0

SECP model

Example application to ambient intelligence scenario

■ Actuators

- ▶ Decision variable x_i , domain \mathcal{D}_{x_i}
- ▶ Cost function $c_i : \mathcal{D}_{x_i} \rightarrow \mathbb{R}$

■ Sensors

- ▶ Read-only variable s_l , domain \mathcal{D}_{s_l}

■ Physical Dependency Models $\langle y_j, \phi_j \rangle$

- ▶ Give the expected state of the environment from a set of actuator-variables influencing this model
- ▶ Variable y_j representing the *expected* state of the environment
- ▶ Function $\phi_j : \prod_{\varsigma \in \sigma(\phi_j)} \mathcal{D}_\varsigma \rightarrow \mathcal{D}_{y_j}$

■ User Preferences

- ▶ Utility function u_k
- ▶ Distance from the current expected state to the target state of the environment

Formulating SECP as a DCOP

Multi-objective optimization problem

$$\begin{aligned}
 & \min_{x_i \in \nu(\mathfrak{A})} \sum_{i \in \mathfrak{A}} c_i \quad \text{and} \quad \max_{\substack{x_i \in \nu(\mathfrak{A}) \\ y_j \in \nu(\Phi)}} \sum_{k \in \mathfrak{R}} u_k \\
 & \text{s.t. } \phi_j(x_j^1, \dots, x_j^{\overline{\phi_j}}) = y_j \quad \forall y_j \in \nu(\Phi)
 \end{aligned}$$

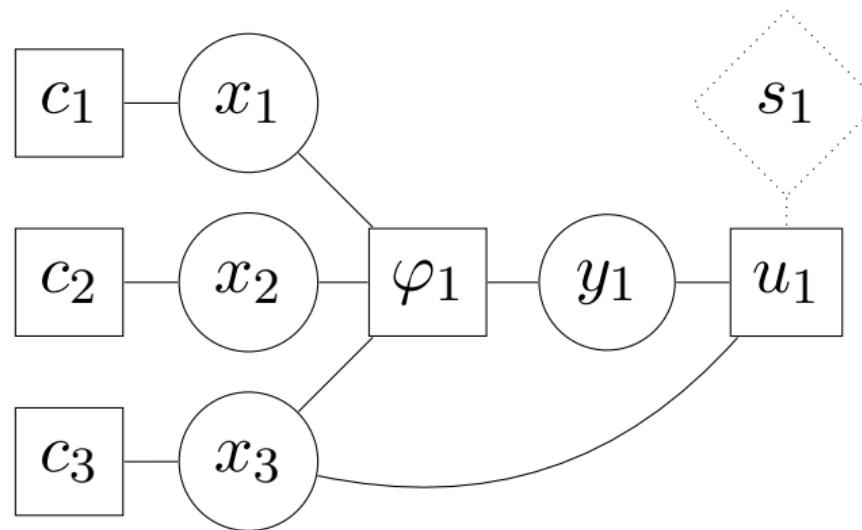

Mono-objective DCOP formulation

$$\max_{\substack{x_i \in \nu(\mathfrak{A}) \\ y_j \in \nu(\Phi)}} \omega_u \sum_{k \in \mathfrak{R}} u_k - \omega_c \sum_{i \in \mathfrak{A}} c_i + \sum_{\varphi_j \in \Phi} \varphi_j$$

$$\varphi_j(x_j^1, \dots, x_j^{|\sigma(\phi_j)|}, y_j) = \begin{cases} 0 & \text{if } \phi_j(x_j^1, \dots, x_j^{|\sigma(\phi_j)|}) = y_j \\ -\infty & \text{otherwise} \end{cases}$$

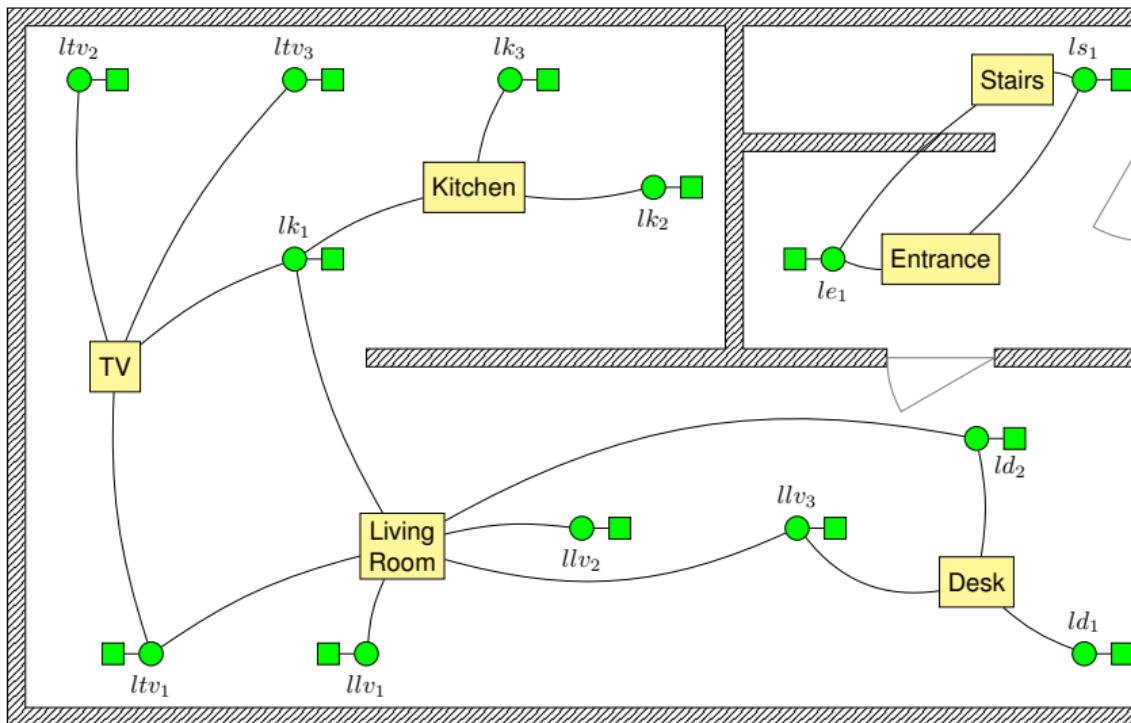

Formulating SECP as a DCOP

Representing a DCOP as a factor graph

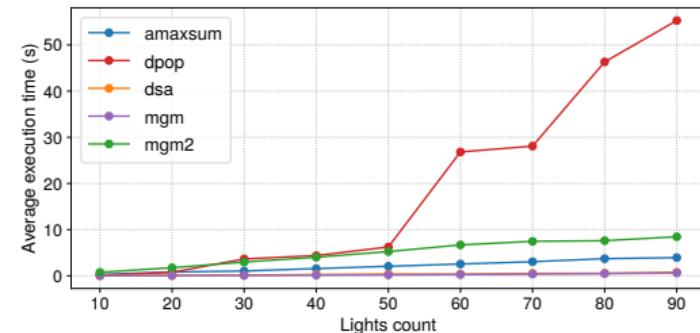

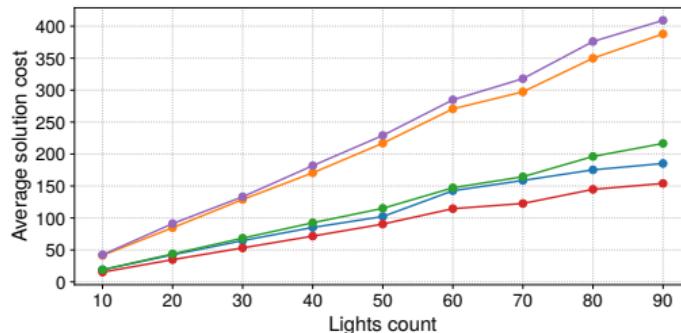

SECP Factor Graph

in a house (without rules)

Algorithms' performances

- Best solutions: DPOP, MaxSum, MGM2
- Worst runtime: DPOP
- Best compromise: MaxSum, MGM2

SECP: further readings

- Experiments with various algorithms [RUST et al., 2016, 2022]
- How to deploy DCOPs [RUST et al., 2017, 2022]
- How to adapt deployment at runtime [RUST et al., 2018, 2020, 2022]

Observation Scheduling in Multi-Owner Constellations

Conclusion and Wrap-up

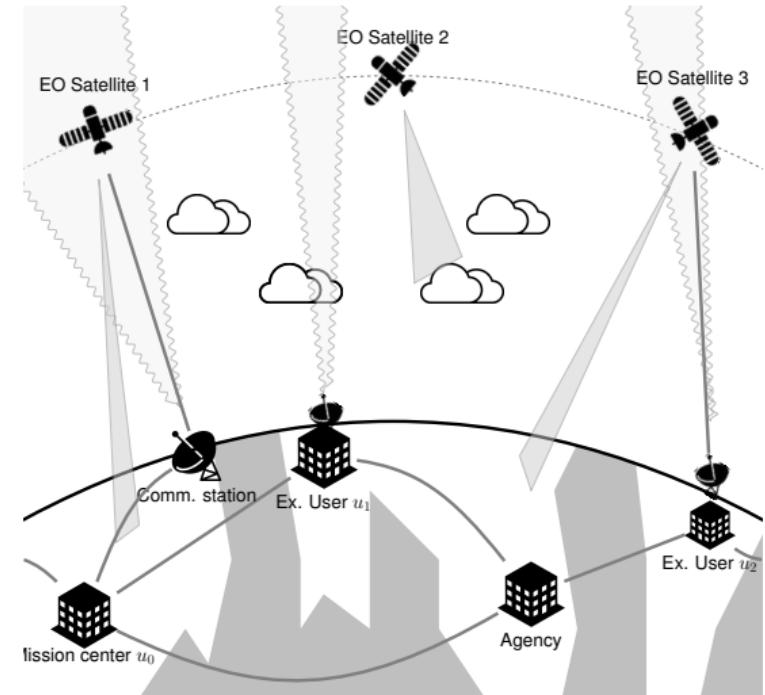

Observation Scheduling in Multi-Owner Constellations [PICARD, 2022]

- Increasing size of deployed EOS constellations
- ⇒ Observe any point on Earth at higher frequency, e.g. Planet constellation
- **but**, requires to **improve coordination and cooperation** between assets and stakeholders
- We focus here on **collective observation scheduling** on a constellation where some users have **exclusive access** to **some orbit portions**
- ⇒ Answer to strong user expectations to benefit both from a shared system (to reduce costs) and a proprietary system (total control and confidentiality)

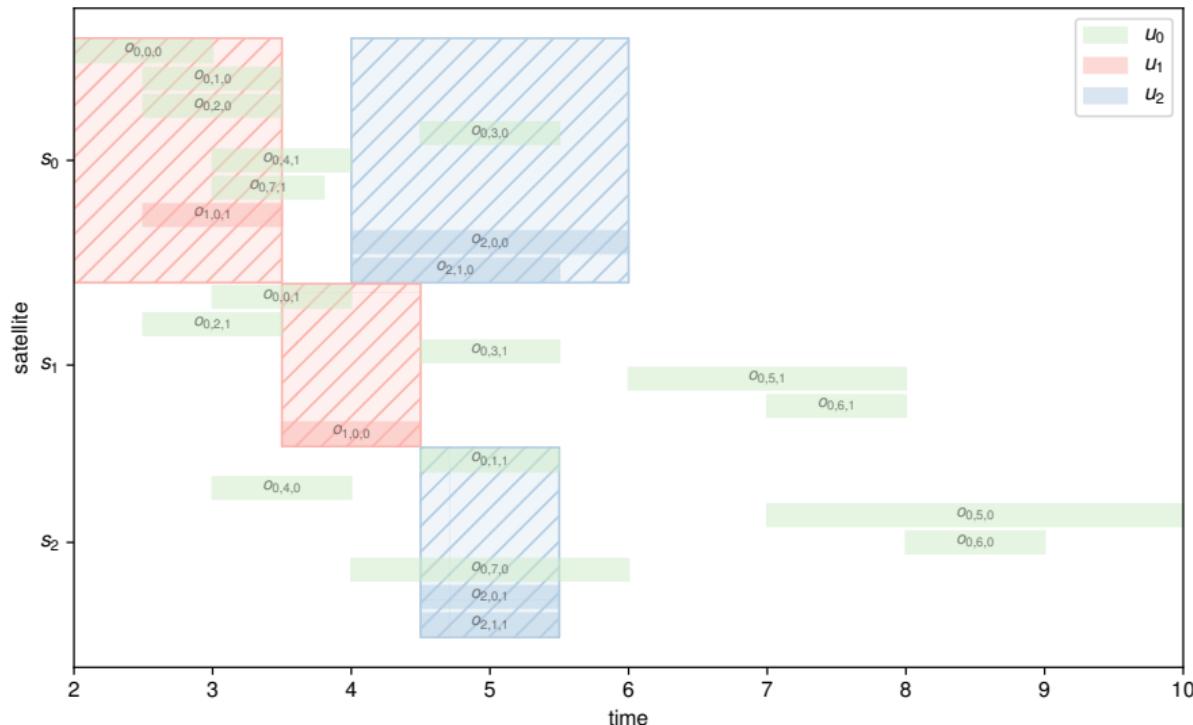

Observation Scheduling in Multi-Owner Constellations [PICARD, 2022]

- **but**, requires to **improve coordination and cooperation** between assets and stakeholders
- We focus here on **collective observation scheduling** on a constellation where some users have **exclusive access to some orbit portions**
- ⇒ Answer to strong user expectations to benefit both from a shared system (to reduce costs) and a proprietary system (total control and confidentiality)

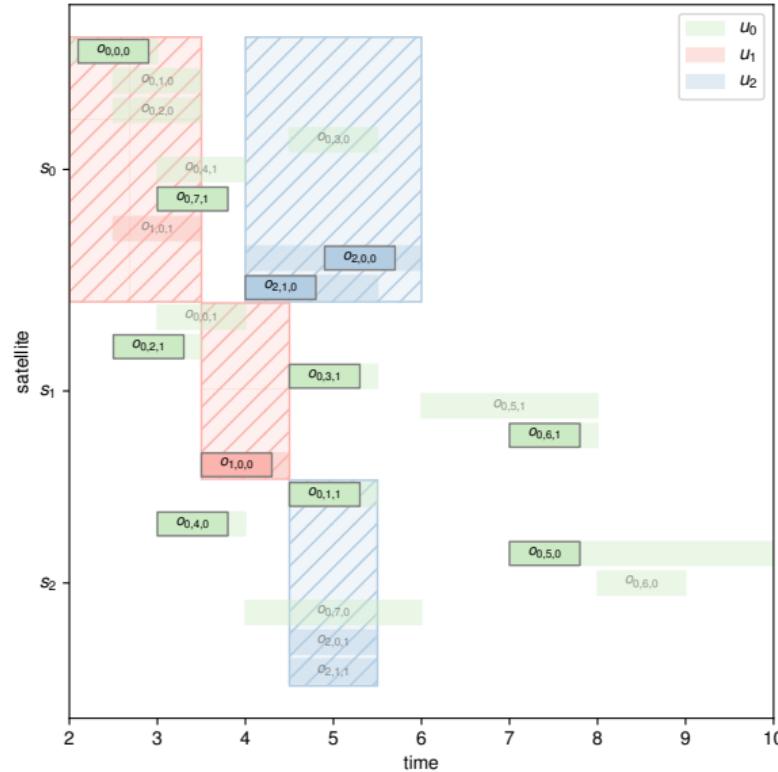

Scheduling Observations with Multiple Exclusive Orbit Portions

Illustrative Example

Scheduling Observations with Multiple Exclusive Orbit Portions

Illustrative Example

DCOP Model

A DCOP $\langle \mathcal{A}, \mathcal{X}, \mathcal{D}, \mathcal{C}, \mu \rangle$ is defined for a given request r , and a current scheduling

- The agents are the exclusive users which can potentially schedule r :

$$\mathcal{A} = \{u \in \mathcal{U}^{\text{ex}} \mid \exists (s, (t_u^{\text{start}}, t_u^{\text{end}})) \in e_u, \exists o \in \theta_r \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\} \quad (1)$$

- Each agent u owns binary decision variables, one for each observation $o \in \mathcal{O}[u]^r$ and exclusive e in its exclusives e_u , stating whether it schedules o in e or not:

$$\mathcal{X} = \{x_{e,o} \mid e \in \bigcup_{u \in \mathcal{A}} e_u, o \in \mathcal{O}[u]^r\} \quad (2)$$

$$\mathcal{D} = \{\mathcal{D}_{x_{e,o}} = \{0, 1\} \mid x_{e,o} \in \mathcal{X}\} \quad (3)$$

with $\mathcal{O}[u]^r = \{o \in \theta_r \mid \exists (s, (t_o^{\text{start}}, t_o^{\text{end}})) \in e_u, \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\}$ are observations related to request r that can be scheduled on u 's exclusives

- μ associates each variable $x_{e,o}$ to e 's owner

DCOP Model

A DCOP $\langle \mathcal{A}, \mathcal{X}, \mathcal{D}, \mathcal{C}, \mu \rangle$ is defined for a given request r , and a current scheduling

- The agents are the exclusive users which can potentially schedule r :

$$\mathcal{A} = \{u \in \mathcal{U}^{\text{ex}} \mid \exists (s, (t_u^{\text{start}}, t_u^{\text{end}})) \in e_u, \exists o \in \theta_r \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\} \quad (1)$$

- Each agent u owns binary decision variables, one for each observation $o \in \mathcal{O}[u]^r$ and exclusive e in its exclusives e_u , stating whether it schedules o in e or not:

$$\mathcal{X} = \{x_{e,o} \mid e \in \bigcup_{u \in \mathcal{A}} e_u, o \in \mathcal{O}[u]^r\} \quad (2)$$

$$\mathcal{D} = \{\mathcal{D}_{x_{e,o}} = \{0, 1\} \mid x_{e,o} \in \mathcal{X}\} \quad (3)$$

with $\mathcal{O}[u]^r = \{o \in \theta_r \mid \exists (s, (t_o^{\text{start}}, t_o^{\text{end}})) \in e_u, \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\}$ are observations related to request r that can be scheduled on u 's exclusives

- μ associates each variable $x_{e,o}$ to e 's owner

- Each agent u owns binary decision variables, one for each observation $o \in \mathcal{O}[u]^r$ and exclusive e in its exclusives e_u , stating whether it schedules o in e or not:

$$\mathcal{X} = \{x_{e,o} \mid e \in \bigcup_{u \in \mathcal{A}} e_u, o \in \mathcal{O}[u]^r\} \quad (2)$$

$$\mathcal{D} = \{\mathcal{D}_{x_{e,o}} = \{0, 1\} \mid x_{e,o} \in \mathcal{X}\} \quad (3)$$

with $\mathcal{O}[u]^r = \{o \in \theta_r \mid \exists (s, (t_u^{\text{start}}, t_u^{\text{end}})) \in e_u, \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\}$ are observations related to request r that can be scheduled on u 's exclusives

- μ associates each variable $x_{e,o}$ to e 's owner

DCOP Model (cont.)

- Constraints should check that at most one observation is scheduled per request (4), that satellites are not overloaded (5), that at most one agent serves the same observation (6)

$$\sum_{e \in \bigcup_{u \in \mathcal{A}} e_u} x_{e,o} \leq 1, \quad \forall u \in \mathcal{X}, \forall o \in \mathcal{O}[u]^r \quad (4)$$

$$\sum_{o \in \{o \in \mathcal{O}[u]^r \mid u \in \mathcal{A}, s_o = s\}, e \in \bigcup_{u \in \mathcal{A}} e_u} x_{e,o} \leq \kappa_s^*, \quad \forall s \in \mathcal{S} \quad (5)$$

$$\sum_{e \in \bigcup_{u \in \mathcal{A}} e_u} x_{e,o} \leq 1, \quad \forall o \in \mathcal{O} \quad (6)$$

- The cost to integrate an observation in the current user's schedule should be assessed to guide the optimization process

$$c(x_{e,o}) = \pi(o, \mathcal{M}_{u_o}), \quad \forall x_{e,o} \in \mathcal{X} \quad (7)$$

where π evaluates the best cost obtained when scheduling o and any combination of observations from \mathcal{M}_{u_o} , as to consider all possible revisions of u_o 's current schedule

$$\mathcal{C} = \{(4), (5), (6), (7)\} \quad (8)$$

DCOP Model (cont.)

- Constraints should check that at most one observation is scheduled per request (4), that satellites are not overloaded (5), that at most one agent serves the same observation (6)

$$\sum_{e \in \bigcup_{u \in \mathcal{A}} e_u} x_{e,o} \leq 1, \quad \forall u \in \mathcal{X}, \forall o \in \mathcal{O}[u]^r \quad (4)$$

$$\sum_{o \in \{o \in \mathcal{O}[u]^r \mid u \in \mathcal{A}, s_o = s\}, e \in \bigcup_{u \in \mathcal{A}} e_u} x_{e,o} \leq \kappa_s^*, \quad \forall s \in \mathcal{S} \quad (5)$$

$$\sum_{e \in \bigcup_{u \in \mathcal{A}} e_u} x_{e,o} \leq 1, \quad \forall o \in \mathcal{O} \quad (6)$$

- The cost to integrate an observation in the current user's schedule should be assessed to guide the optimization process

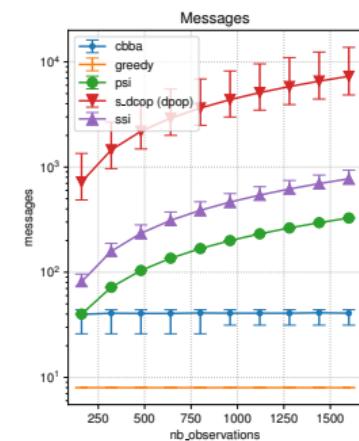

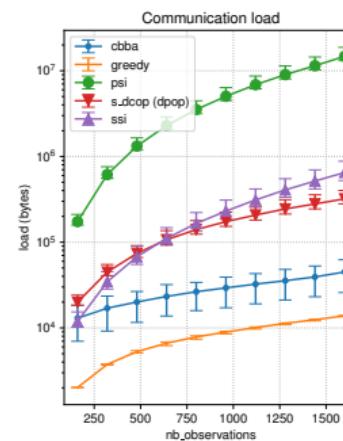

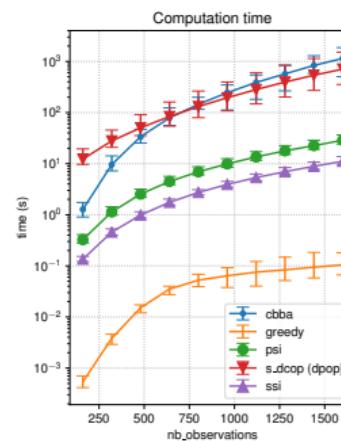

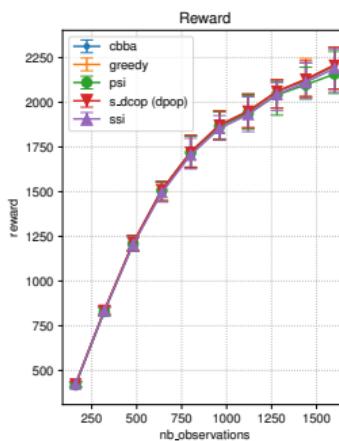

$$c(x_{e,o}) = \pi(o, \mathcal{M}_{u_o}), \quad \forall x_{e,o} \in \mathcal{X} \quad (7)$$

where π evaluates the best cost obtained when scheduling o and any combination of observations from \mathcal{M}_{u_o} , as to consider all possible revisions of u_o 's current schedule

$$\mathcal{C} = \{(4), (5), (6), (7)\} \quad (8)$$

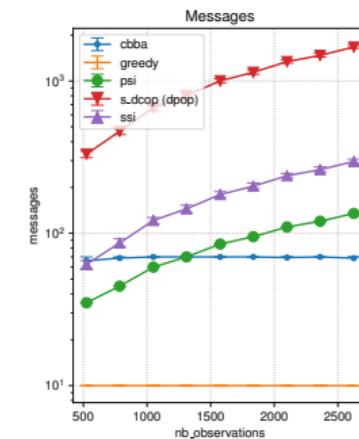

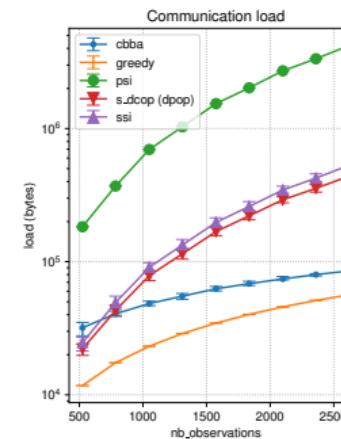

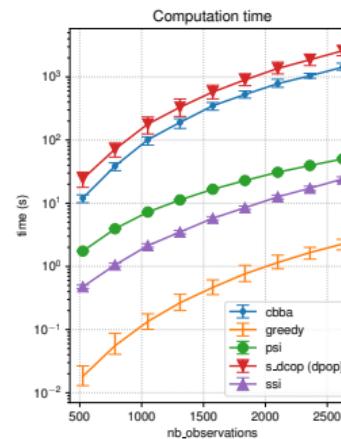

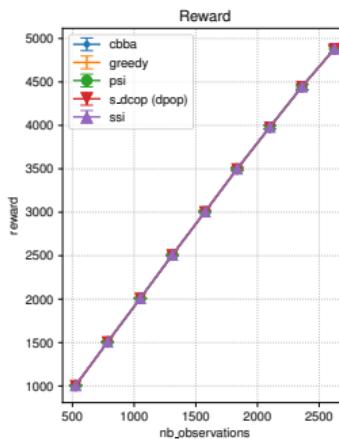

Highly conflicting randomly generated problems

5-min horizon with overlapping requests and limited capacity

Realistic randomly generated problems

6-hour horizon with numerous requests and large capacity

Today's Menu

Introduction and Motivations

Coalition Formation on MAS

Distributed Constraint Optimization

Real-World Applications

Conclusion and Wrap-up

Conclusion and Wrap-up

What We've Seen Today

- 2 major multi-agent constraint optimization frameworks: **DCOP, CF**
 - ▶ DCOP: how to **collectively solve** constraint optimization problems
 - ▶ CF: how to **form coalitions/groups** with respect to some criteria and constraints
- Various **techniques and algorithms** to attack these problems
- Examples of **applications** in the transportation, IoT, space and energy domain

Conclusion and Wrap-up

Open questions

Distributed constraint optimization

- How to **decompose or regroup** as to reduce **interactions**?
- How to **structure** the system as to improve **parallelism**?
- How to deploy and make systems robust and resilient in **dynamic environments**?

Coalition formation

- Which other **realistic** scenarios can we model as $m + a$?
- Can we exploit some other **properties** for scenarios that are not $m + a$ (e.g., shared mobility)?
- More in general, how can we **improve** the **scalability** of CF approaches?

Common questions

- How to use DCOPs in CF and vice versa?
- Maintaining libraries and data sets

Special Thanks

Special thanks to all previous contributors to tutorials on multi-agent optimization and related topics, notably

Ferdinando Fioretto, Long Tran-Thanh, Pierre Rust, Enrico Pontelli, William Yeoh, Jesus Cerquides, Juan Antonio Rodriguez Aguilar, Alessandro Farinelli, Pedro Meseguer, Sarvapali Ramchurn, Amnon Meisels
