

# Multi-Agent Distributed Constrained Optimization

## Tutorial at AAMAS'22

Gauthier Picard   Filippo Bistaffa

# Introduction and Motivations

Who are we?

Gauthier Picard, PhD, Prof.  
ONERA, the French Aerospace Lab  
Expertises: DCOPs, self-organization,  
resource allocation

Filippo Bistaffa, PhD  
IIIA-CSIC, Barcelona  
Expertises: coalition formation,  
parallel computing, shared mobility

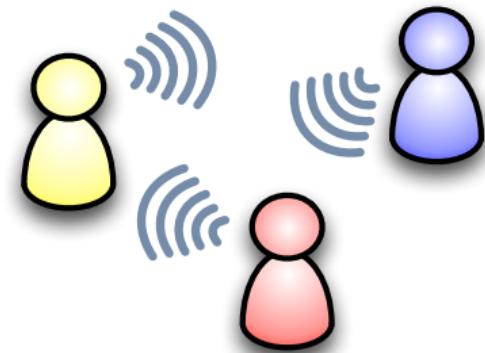

# Introduction and Motivations

## Multiagent Systems

- **Agent**: An entity that behaves autonomously in the pursuit of goals
- **Multi-agent system**: A system of multiple interacting agents

An agent is...

- **Autonomous**: Is of full control of itself
- **Interactive**: May communicate with other agents
- **Reactive**: Responds to changes in the environment or requests by other agents
- **Proactive**: Takes initiatives to achieve its goals

# Introduction and Motivations

Research questions addressed during this tutorial

- How to make collective optimal decisions?
  - ▶ How to model the collective decision?
  - ▶ Which protocols to implement these decisions?
  
- How to form groups *wrt* to some utility criteria?
  - ▶ How to model the utility of each group?
  - ▶ How to express which groups are feasible or not?

# Today's Menu

W	W	W	X

Model the problem  
as a Max-CSP!

## WCSP (or COP)

## Constraint Optimization

$x_1$	$x_3$	$x_5$	Cost
N	N	N	$\infty$
N	N	E	$\infty$
...			$\infty$
S	W	N	10
...			$\infty$
W	W	W	$\infty$

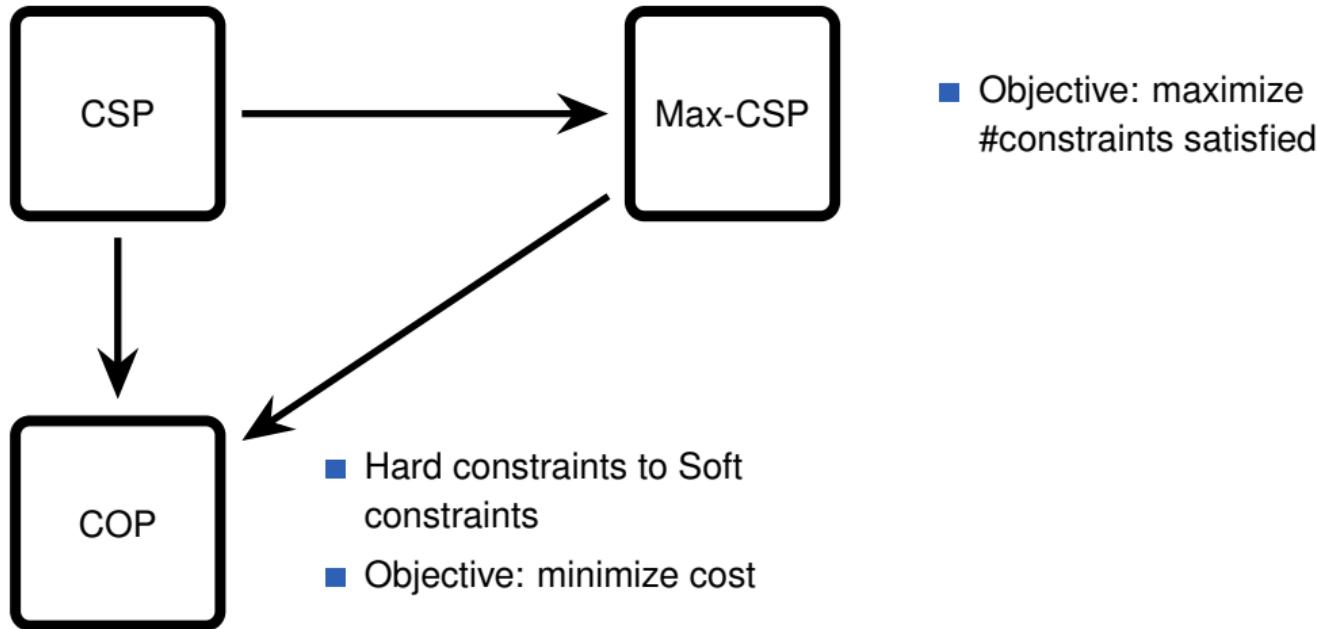

Model the problem  
as a COP!

## WCSP (or COP)

## Constraint Optimization

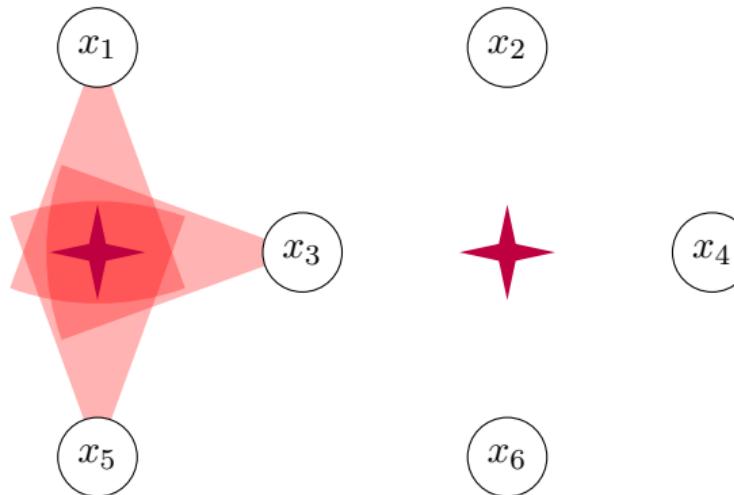

- Variables  $X = \{x_1, \dots, x_n\}$
  - Domains  $D = \{D_1, \dots, D_n\}$
  - Constraints  $C\{c_1, \dots, c_m\}$   
where a constraint  $c_i : D_{i_1} \times D_{i_2} \times \dots \times D_{i_n} \rightarrow \mathbb{R}_+ \cup \{\infty\}$  expresses the degree of constraint violation
  - **Goal:** Find an assignment to all variables that minimizes the sum of all the constraints

## Constraint Reasoning

## WCSP (or COP)

## Constraint Optimization

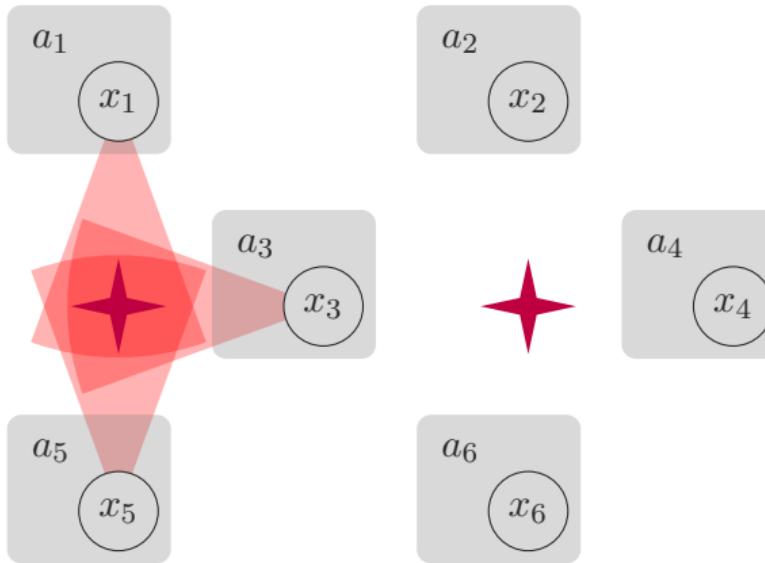

Imagine that each sensor is an autonomous agent

*How should this problem be modeled and solved in a decentralized manner?*

# DCOP

Distributed Constraint Optimization [MODI et al., 2005]

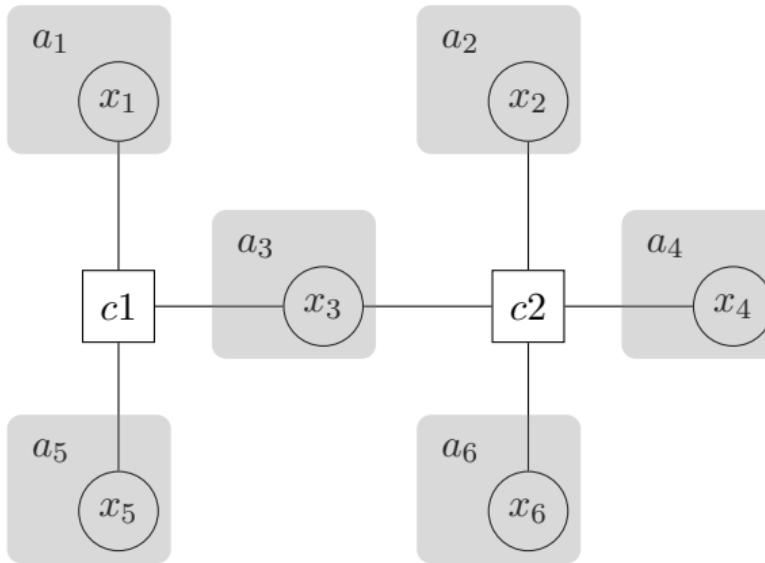

Imagine that each sensor is an autonomous agent

*How should this problem be modeled and solved in a decentralized manner?*

# DCOP

Distributed Constraint Optimization [MODI et al., 2005]

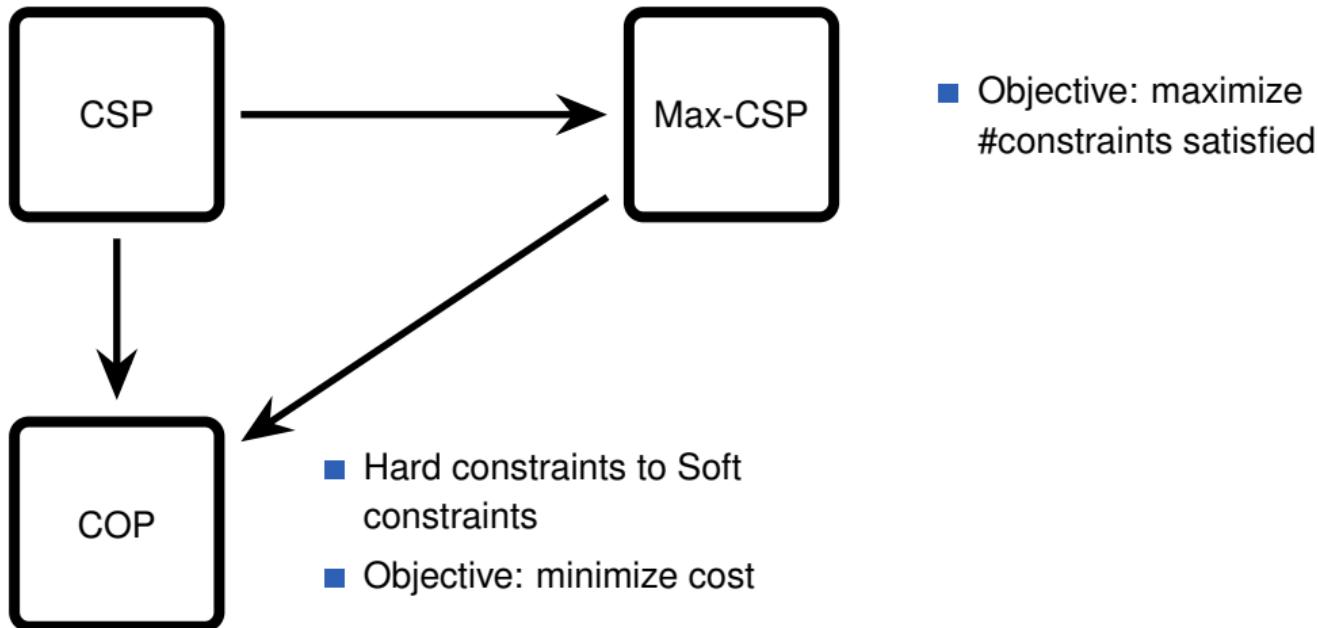

# DCOP

Distributed Constraint Optimization [MODI et al., 2005]

- Agents  $X = \{a_1, \dots, a_l\}$
- Variables  $X = \{x_1, \dots, x_n\}$
- Domains  $D = \{D_1, \dots, D_n\}$
- Constraints  $C\{c_1, \dots, c_m\}$
- Mapping of variables to agents
- **Goal:** Find an assignment to all variables that **minimizes the sum of all the constraints**

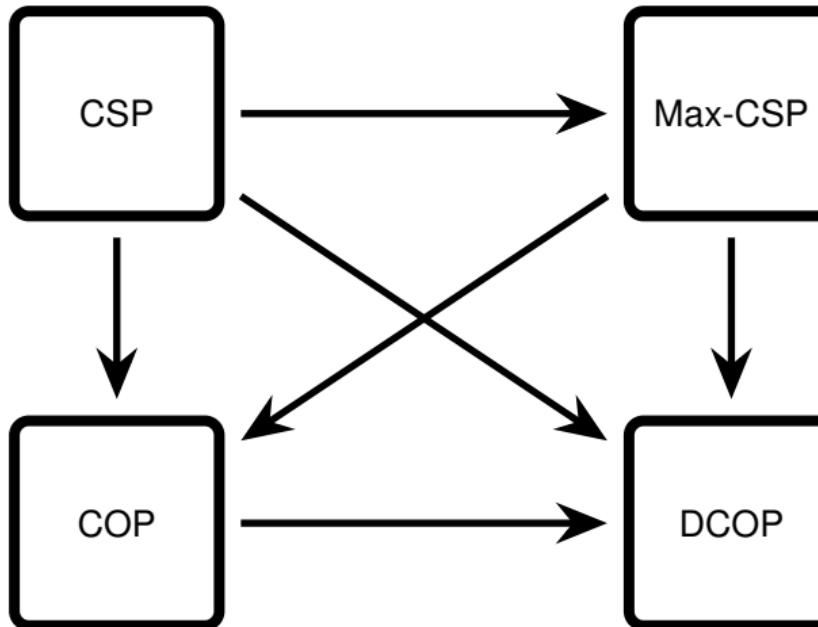

# DCOP

Distributed Constraint Optimization [MODI et al., 2005]

# DCOP

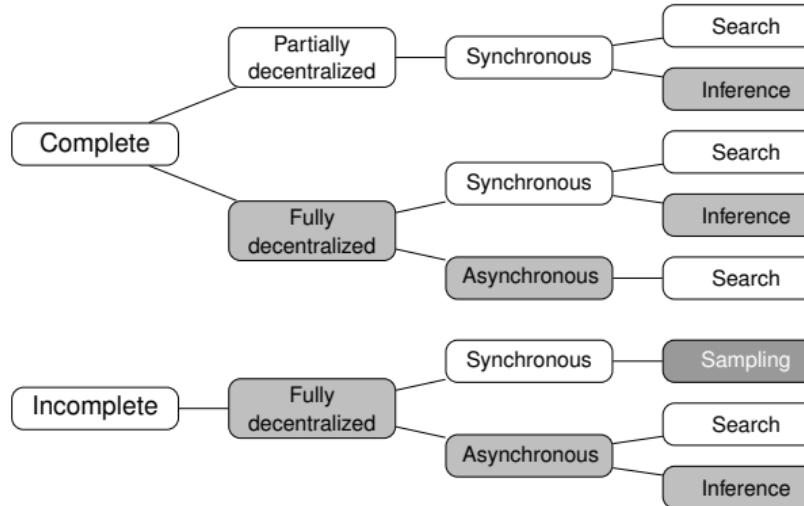

Distributed Constraint Optimization [Modi et al., 2005]

- Variables are controlled by agents
- Communication model
- Local knowledge

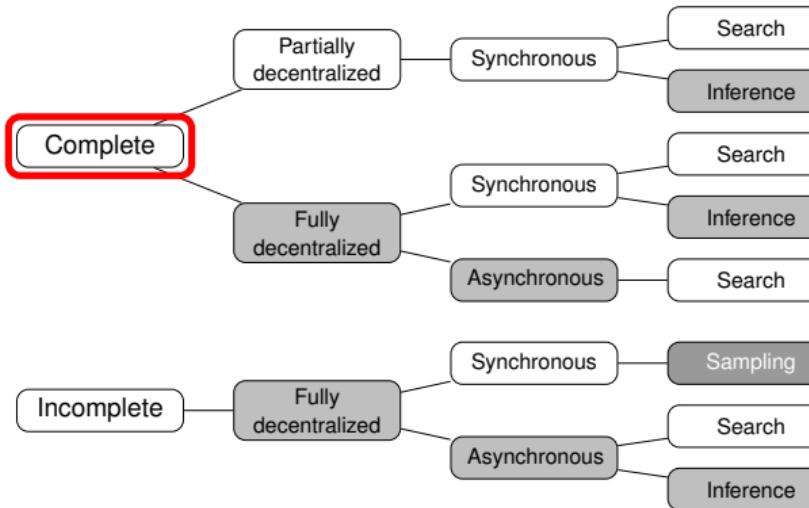

# DCOP Algorithms

See [FIORETTA et al., 2018]

## DCOP Algorithms

See [FIORETTTO et al., 2018]

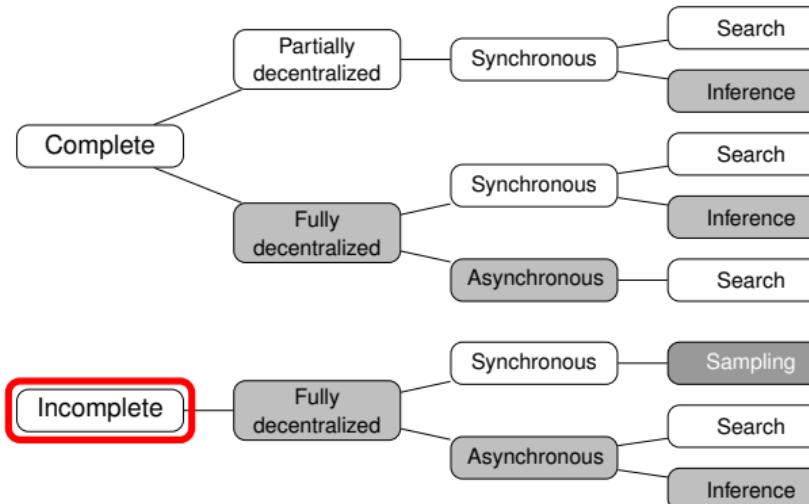

## Important metrics

- Agent complexity
  - Network loads
  - Message size

# DCOP Algorithms

See [FIORETTA et al., 2018]

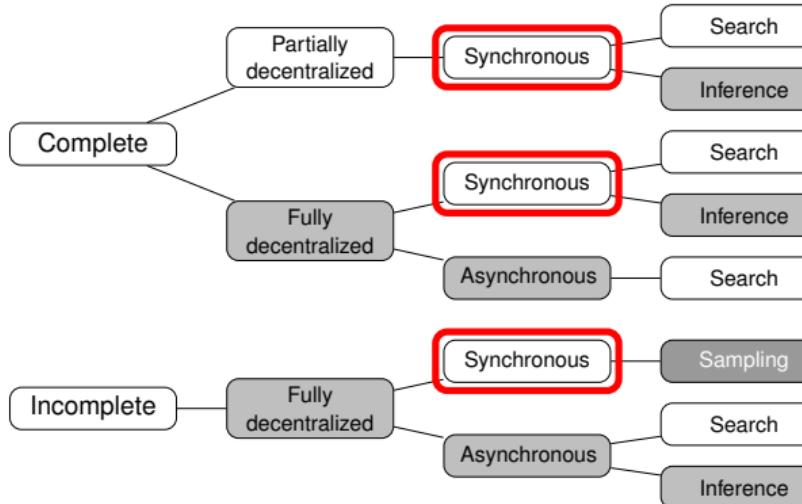

## Important metrics

- Agent complexity
- Network loads
- Message size
- Anytime
- Quality guarantees
- Execution time vs. solution quality

# DCOP Algorithms

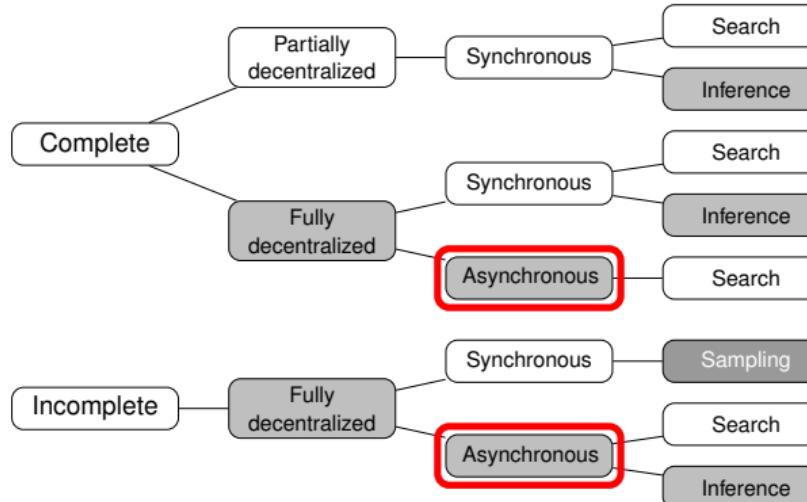

See [FIORETTA et al., 2018]

- Systematic process, divided in steps
- Each agent waits for particular messages before acting
- Consistent view of the search process
- Typically, increases idle-time

# DCOP Algorithms

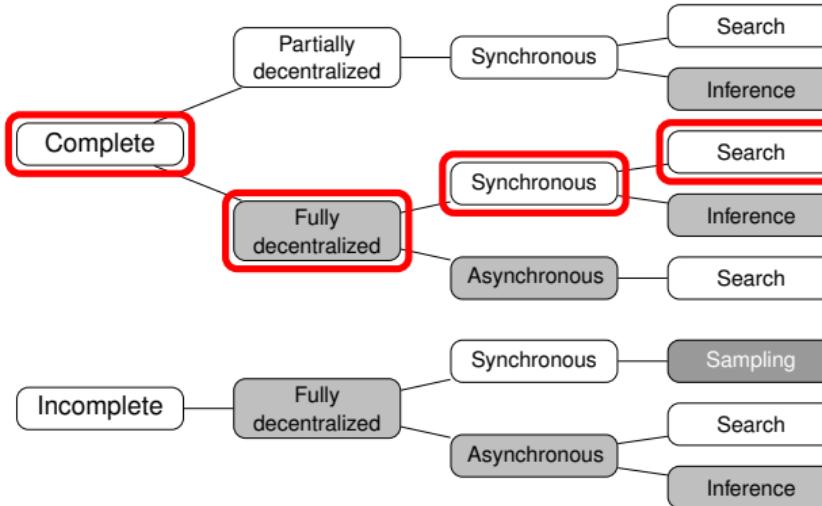

See [FIORETTA et al., 2018]

- Decision based on agents' local state
- Agents' actions do not depend on sequence of received messages
- Minimizes idle-time
- No guarantees on validity of local views

# DCOP Algorithms

See [FIORETTA et al., 2018]

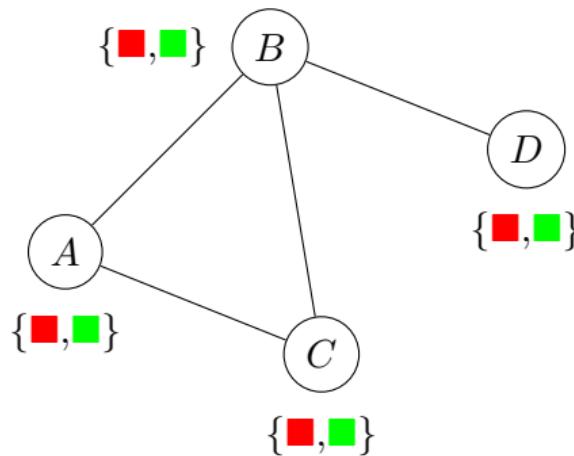

## Synchronous Branch-and-Bound (SBB)

[HIRAYAMA and YOKOO, 1997]

## Synchronous Branch-and-Bound (SBB)

[HIRAYAMA and Yokoo, 1997]

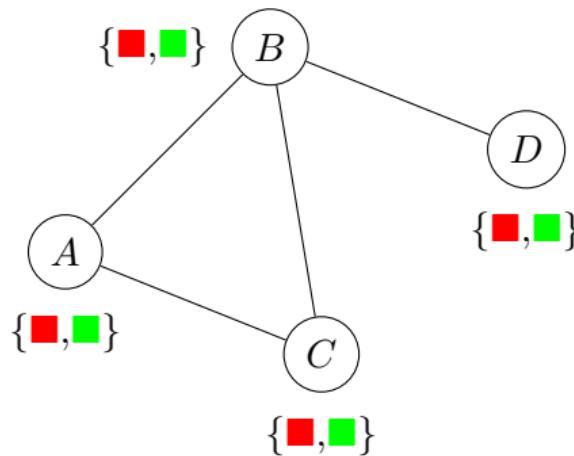

$x_i$	$x_j$	$(A, B)$	$(A, C)$	$(B, C)$	$(B, C)$
		5	5	5	3
		8	10	4	8
		20	20	3	10
		3	3	3	3

How do we solve this distributedly?

## Synchronous Branch-and-Bound (SBB)

[HIRAYAMA and Yokoo, 1997]

$x_i$	$x_j$	$(A, B)$	$(A, C)$	$(B, C)$	$(B, C)$
red	red	5	5	5	3

green	red	20	20	3	10
green	green	3	3	3	3

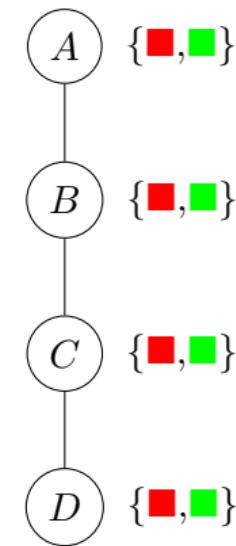

How do we solve this distributedly?

## Synchronous Branch-and-Bound (SBB)

[HIRAYAMA and Yokoo, 1997]

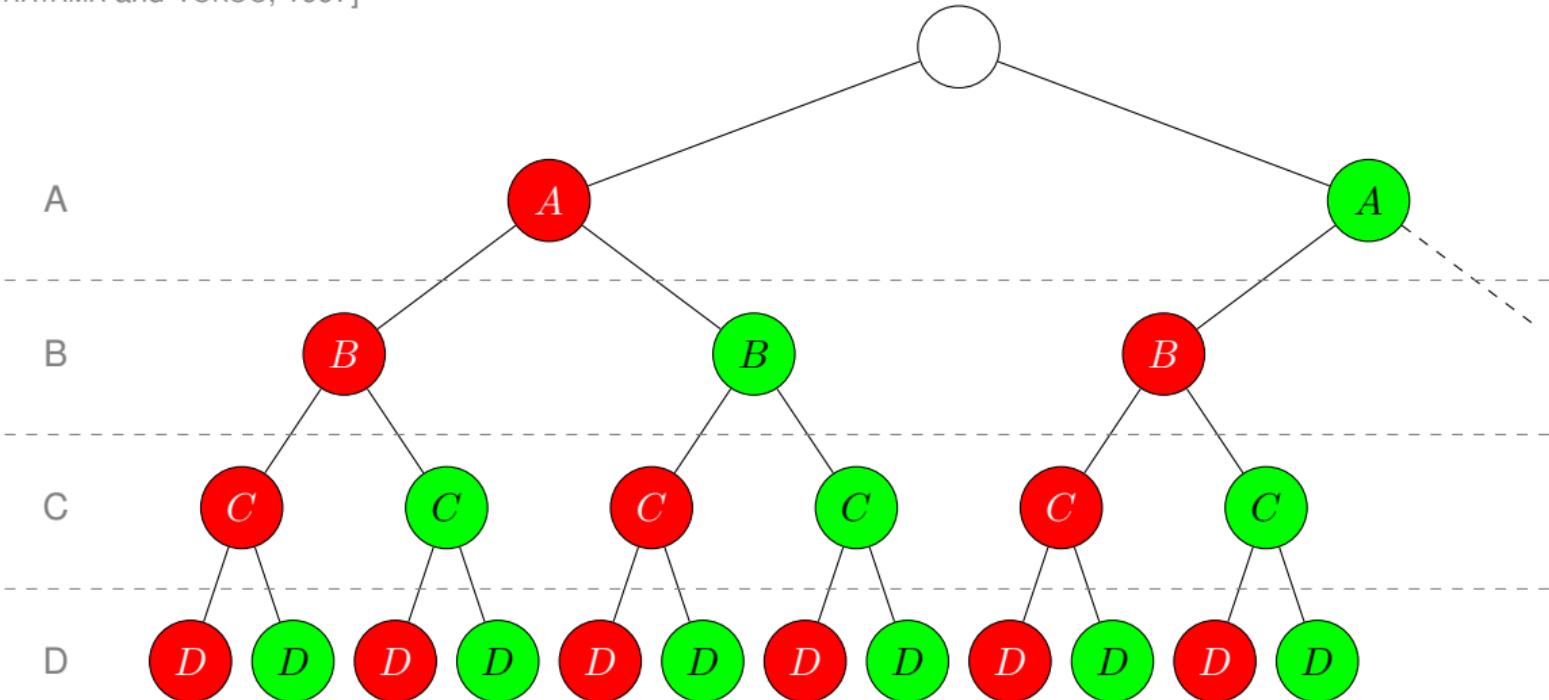

- Agents operate on a complete ordering
- Agents exchange CPA messages containing partial assignments
- When a solution is found, its solution cost as an UB is broadcasted to all agents
- The UB is used for branch pruning

Complete ordering

## Pseudo-Tree

### Definition (Pseudo-Tree)

A spanning tree of the constraint graph such that no two nodes in sibling subtrees share a constraint in the constraint graph

## Pseudo-Tree

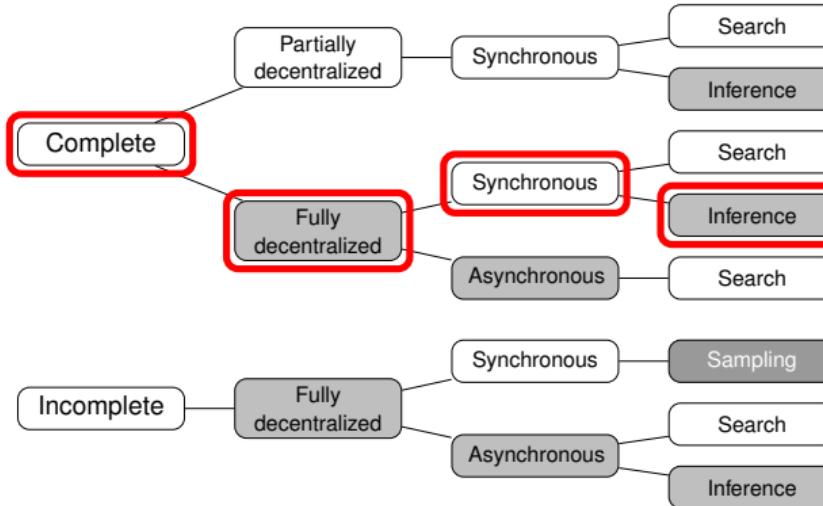

### Definition (Pseudo-Tree)

A spanning tree of the constraint graph such that no two nodes in sibling subtrees share a constraint in the constraint graph

# DCOP Algorithms

See [FIORETTA et al., 2018]

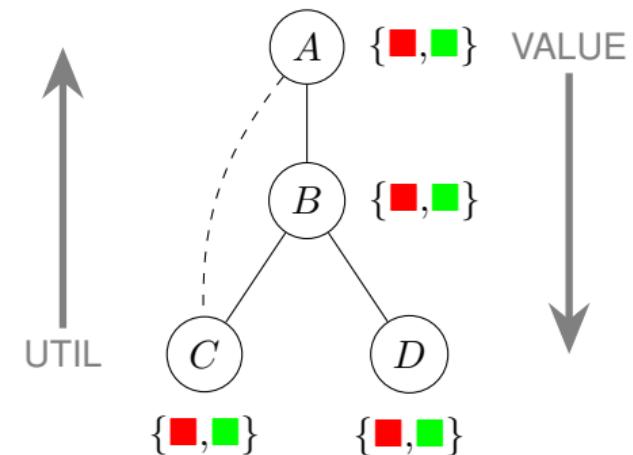

## Distributed Pseudotree Optimization Procedure (DPOP)

[PETCU and FALTINGS, 2005b]

# DPOP

[PETCU and FALTINGS, 2005b]

- Extension of the Bucket Elimination (BE)
- Agents operate on a pseudo-tree ordering
- UTIL phase: Leaves to root
- VALUE phase: Root to leaves

## DPOP

[PETCU and FALTINGS, 2005b]

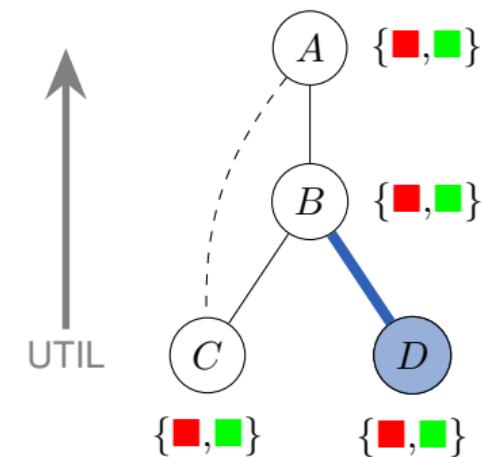

$B$	$D$	$(B, D)$
$r$	$r$	3
$r$	$g$	8
$g$	$r$	10
$g$	$g$	3

$$\min\{3, 8\} = 3$$

$$\min\{10, 3\} = 3$$

Message to B

$B$	cost
$r$	3
$g$	3

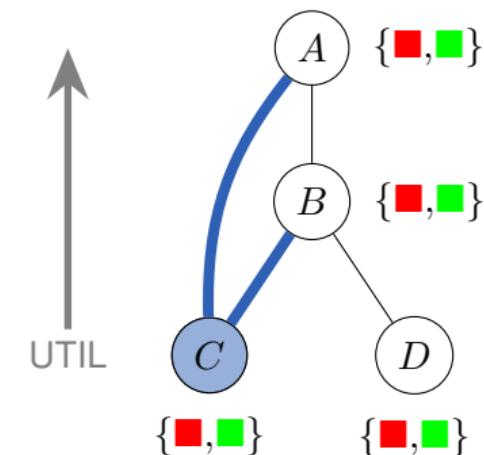

## DPOP

[PETCU and FALTINGS, 2005b]

$A$	$B$	$C$	$(B, C)$	$(A, C)$	cost
$r$	$r$	$r$	5	5	10

## Distributed Local Search

[MAHESWARAN et al., 2004; ZHANG et al., 2003]

## Local Search Algorithms

- DSA: Distributed Stochastic Search [ZHANG et al., 2005]
- MGM: Maximum Gain Messages Algorithm [MAHESWARAN et al., 2004]
- Note: we now maximize utilities
- Every agent individually decides whether to change its value or not
- Decision involves
  - ▶ knowing neighbors' values
  - ▶ calculation of utility gain by changing values
  - ▶ probabilities

$x_i$	$x_j$	$(A, B)$	$(B, C)$
red	red	5	5
red	green	5	0
green	red	0	0
green	green	8	8

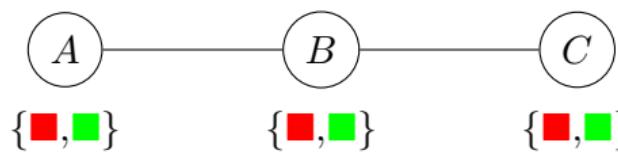

# DSA Algorithm

[ZHANG et al., 2005]

- All agents execute the following
  - ▶ Randomly choose a value
  - ▶ while (termination is not met)
    - ▶ if (a new value is assigned): send the new value to neighbors
    - ▶ collect neighbors' new values if any
    - ▶ select and assign the next value based on assignment rule

# DSA Algorithm

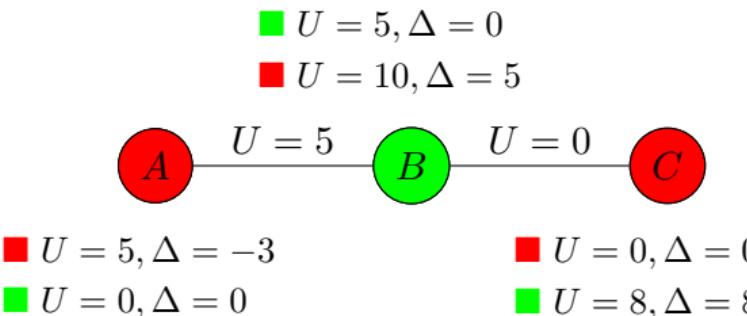

[ZHANG et al., 2005]

$x_i$	$x_j$	$(A, B)$	$(B, C)$

5	5		
5	0		
0	0		
8	8		

# MGM Algorithm

[MAHESWARAN et al., 2004]

- All agents execute the following
  - ▶ Randomly choose a value
  - ▶ while (termination is not met)
    - ▶ if (a new value is assigned): send the new value to neighbors
    - ▶ collect neighbors' new values if any
    - ▶ calculate gain and send it to neighbors
    - ▶ collect neighbors' gains
    - ▶ if (it has the highest gain among all neighbors): change value to the value that maximizes gain

Large Great if you need an anytime algorithm!

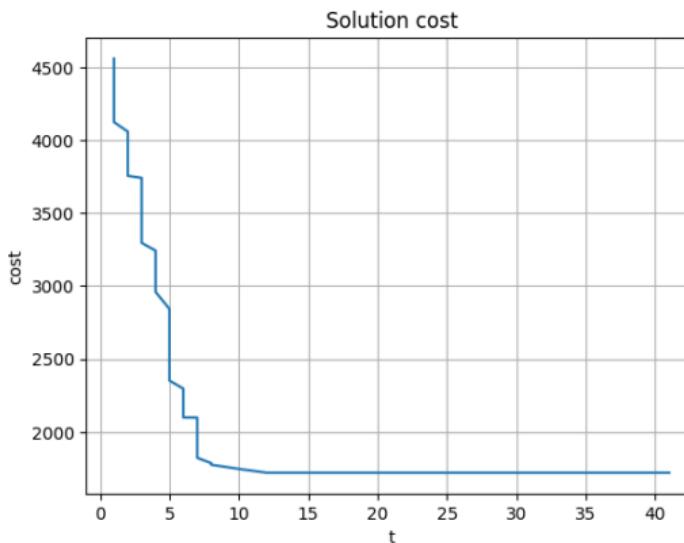

# MGM Algorithm

[MAHESWARAN et al., 2004]

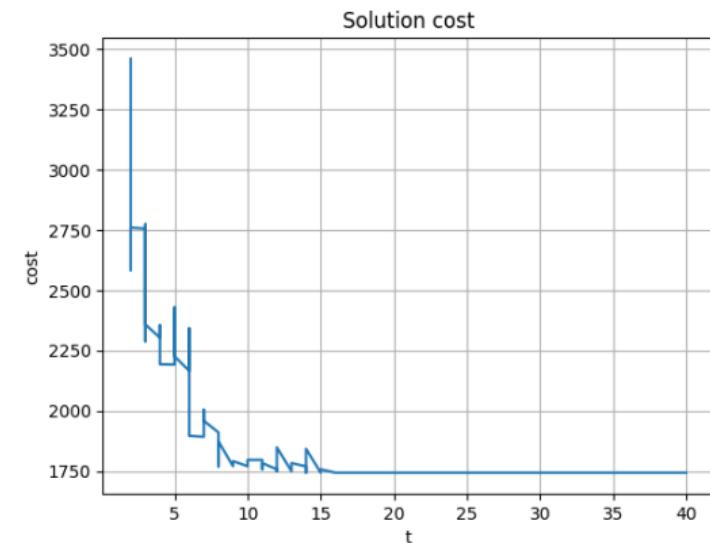

- All agents execute the following
  - ▶ Randomly choose a value
  - ▶ while (termination is not met)
    - ▶ if (a new value is assigned): send the new value to neighbors
    - ▶ collect neighbors' new values if any
    - ▶ calculate gain and send it to neighbors
    - ▶ collect neighbors' gains
    - ▶ if (it has the highest gain among all neighbors): change value to the value that maximizes gain

Large Great if you need an anytime algorithm!

## Extensions to the DCOP Framework

### ■ Dynamic DCOPs

- ▶ SDPOP [PETCU and FALTINGS, 2005a], I-ADOPT and I-BnB-ADOPT [YEOH et al., 2011], FMS [RAMCHURN et al., 2010]

### ■ Multi-Objective DCOPs

- ▶ MO-SBB [MEDI et al., 2014], Pseudo-tree Based Algorithm [MATSUI et al., 2012], B-MOMS [DELLE FAVE et al., 2011], DP-AOF [OKIMOTO et al., 2013]

### ■ Asymmetric DCOPs

- ▶ SyncABB-2ph, SyncABB-1ph, ACLS, MCS-MGM [GRINSHPOUN et al., 2013]

### ■ Probabilistic DCOPs

- ▶  $\mathbb{E}[\text{DPOP}]$  and SD-DPOP [LÉAUTÉ and FALTINGS, 2011; NGUYEN et al., 2012], U-GDL [STRANDERS et al., 2011]

### ■ Continuous DCOPs

- ▶ CMS [STRANDERS et al., 2009], HCMS [VOICE et al., 2010], PFD [CHOUDHURY et al., 2020], EC-DPOP, AC-DPOP, CAC-DPOP, C-DSA [HOANG et al., 2020], C-CoCoA [SARKER et al., 2021]

- ...

## Set of Agents $A$

$$A = \{ \text{}, \text{}, \text{}, \text{} \}$$

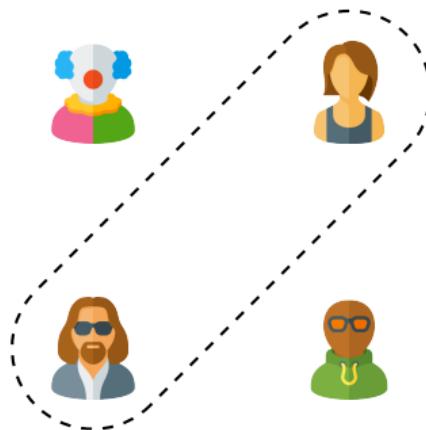

## Characteristic Function $v(\cdot)$

- $v(\{\text{以人为中心}\}) = 0$
  - $v(\{\text{以人和狗为中心}\}) = -7$
  - $v(\{\text{以人和花为中心}\}) = 3$
  - ...

## Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

## Set of Agents $A$

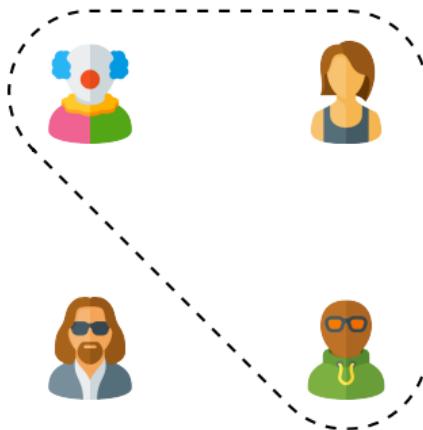

$$A = \{\text{用人}, \text{小孩}, \text{女人}, \text{老人}\}$$

## Characteristic Function $v(\cdot)$

- $v(\{\text{👨, 👩}\}) = 0$
  - $v(\{\text{👨, 👩, 👩}\}) = -7$
  - $v(\{\text{👨, 👩, 👩}\}) = 3$
  - ...

## Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

## Set of Agents $A$

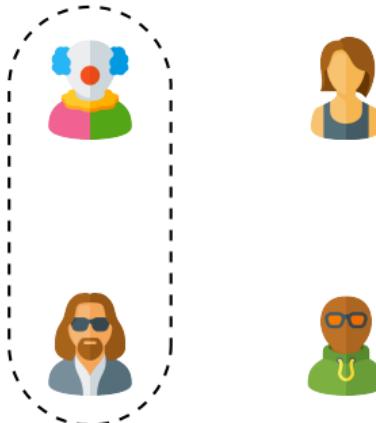

$$A = \{\text{, , , }\}$$

## Characteristic Function $v(\cdot)$

- $v(\{\text{👤, 👤}\}) = 0$
  - $v(\{\text{👤, 🎨, 🎭}\}) = -7$
  - $v(\{\text{👤, 🎨}\}) = 3$
  - ...

## Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

## Set of Agents $A$

$$A = \{ \text{👨}, \text{🧩}, \text{👩}, \text{👤} \}$$

## Characteristic Function $v(\cdot)$

- $v(\{\text{以人为中心}\}) = 0$
  - $v(\{\text{以人和女童为中心}\}) = -7$
  - $v(\{\text{以人和男童为中心}\}) = 3$
  - ...

## Characteristic Function Games (CFGs)

[CHALKIADAKIS et al., 2011]

## Set of Agents $A$

$$A = \{ \text{}, \text{}, \text{}, \text{} \}$$

## Characteristic Function $v(\cdot)$

- $v(\{\text{以人为中心}\}) = 0$
  - $v(\{\text{以人和狗为中心}\}) = -7$
  - $v(\{\text{以人和花为中心}\}) = 3$
  - ...

## Characteristic Function

[CHALKIADAKIS et al., 2011]

## Characteristic Function

The function  $v : \mathcal{P}(A) \rightarrow \mathbb{R}$  associates a value to *every coalition* (i.e., subset) of  $A$

## Exponential Complexity

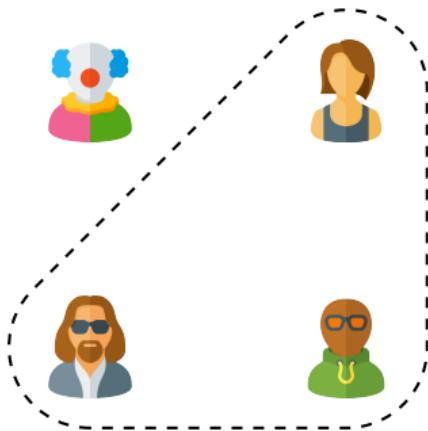

Representing  $v(\cdot)$  as a *table* requires an *exponential* number of steps (i.e.,  $2^{|A|}$ )

## Mitigate this Complexity

(1) Restrict the set of coalitions or (2) consider  $v(\cdot)$  with a specific structure

## Cardinality-Restricted CFGs

[SHEHORY and KRAUS, 1998]

### Maximum Cardinality $k$

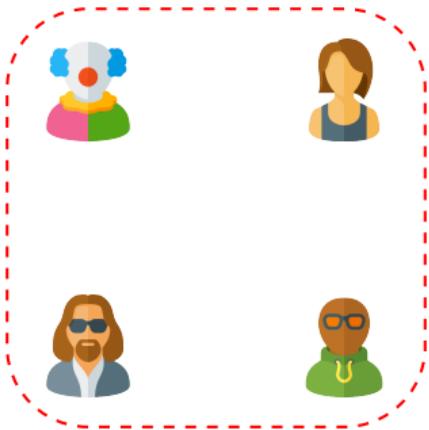

E.g., only coalitions of size  $\leq 3$  are feasible

## Polynomial Number of Coalitions

Total number of coalitions is  $\sum_{i=1}^k \binom{|A|}{i} = \mathcal{O}(|A|^k)$ ,  
i.e., *polynomial* wrt  $|A|$

## Cardinality-Restricted CFGs

[SHEHORY and KRAUS, 1998]

### Maximum Cardinality $k$

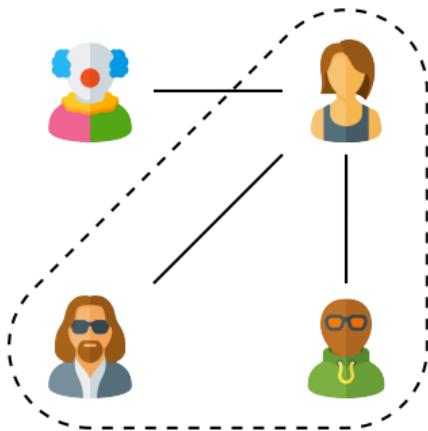

E.g., only coalitions of size  $\leq 3$  are feasible

## Polynomial Number of Coalitions

Total number of coalitions is  $\sum_{i=1}^k \binom{|A|}{i} = \mathcal{O}(|A|^k)$ ,  
i.e., *polynomial* wrt  $|A|$

# Graph-Restricted CFGs

[MYERSON, 1977], [DEMANGE, 2004]

## Graph $G$ among Agents

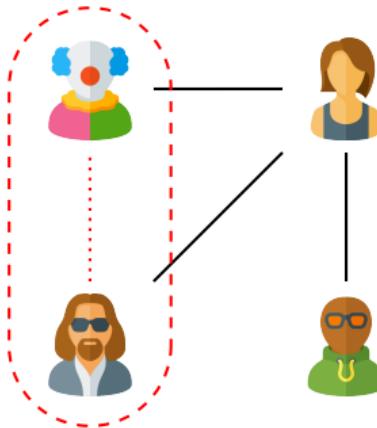

$$G = (\{ \text{Agent 1}, \text{Agent 2}, \text{Agent 3}, \text{Agent 4} \}, \{ (\text{Agent 1}, \text{Agent 2}), (\text{Agent 1}, \text{Agent 3}), (\text{Agent 2}, \text{Agent 3}) \})$$

## Connected Subgraphs

A coalition is *feasible* only if it induces a *connected* subgraph of  $G$

# Graph-Restricted CFGs

[MYERSON, 1977], [DEMANGE, 2004]

## Graph $G$ among Agents

$$G = (\{ \text{Agent 1}, \text{Agent 2}, \text{Agent 3}, \text{Agent 4}, \text{Agent 5} \}, \{ (\text{Agent 1}, \text{Agent 2}), (\text{Agent 2}, \text{Agent 3}), (\text{Agent 3}, \text{Agent 4}) \})$$

## Connected Subgraphs

A coalition is *feasible* only if it induces a *connected* subgraph of  $G$

## Real-World Example: Social Ridesharing

[BISTAFFA et al., 2017b]

### Social Ridesharing

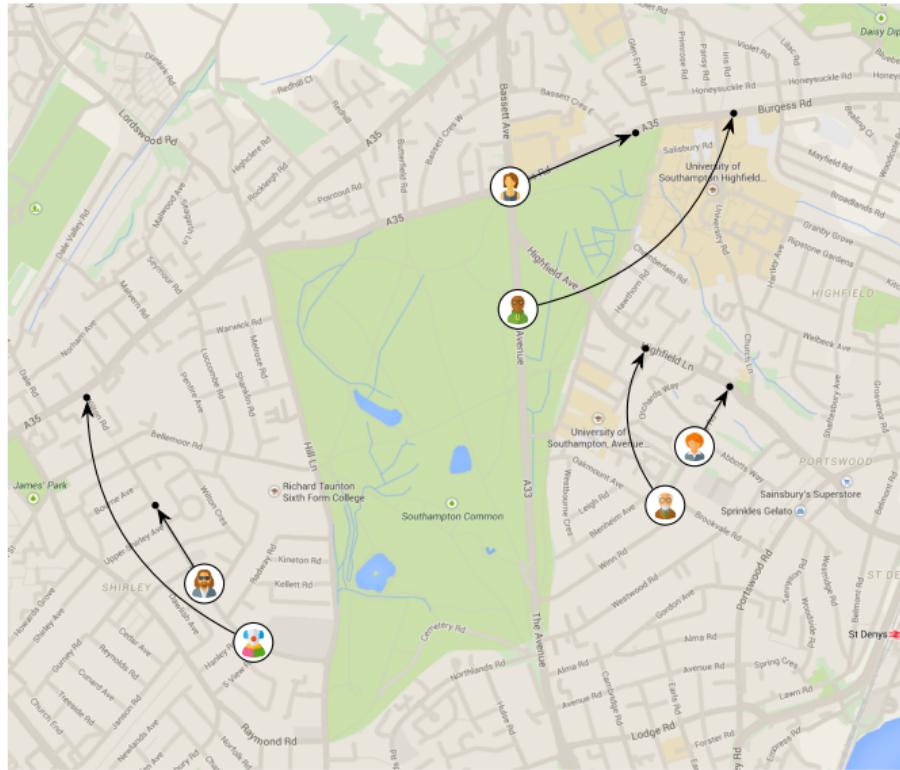

Arrange *cost-effective* shared cars among agents connected by a *social network*

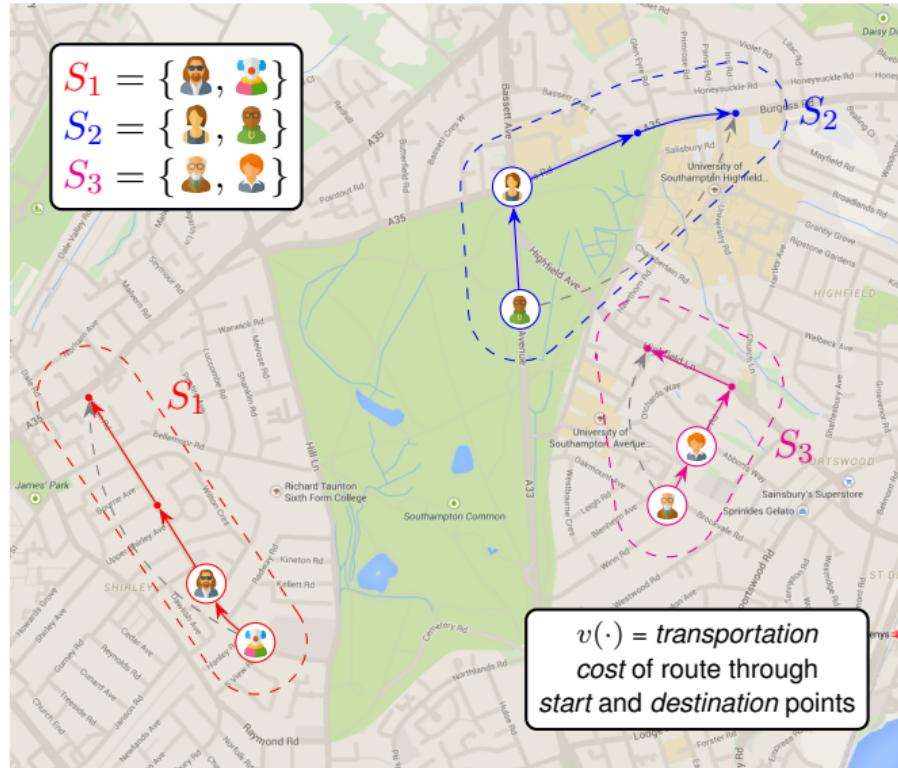

### Cardinality-Based Constraints

Cars (i.e., coalitions) can contain *up to 5 passengers*

### Graph-Based Constraints

We only form coalitions among “*friends of friends*” (connected subgraph)

# Coalition Structure Generation (CSG)

[RAHWAN et al., 2015]

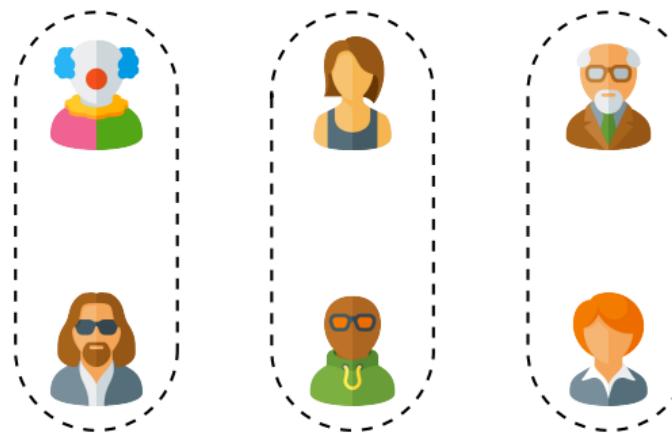

## Solving the Coalition Structure Generation (CSG) Problem

Compute the partition  $\mathcal{S}$  of  $A$  into *feasible* coalitions that *maximizes* the sum  $\sum_{S \in \mathcal{S}} v(S)$

# Coalition Structure Generation (CSG)

[RAHWAN et al., 2015]

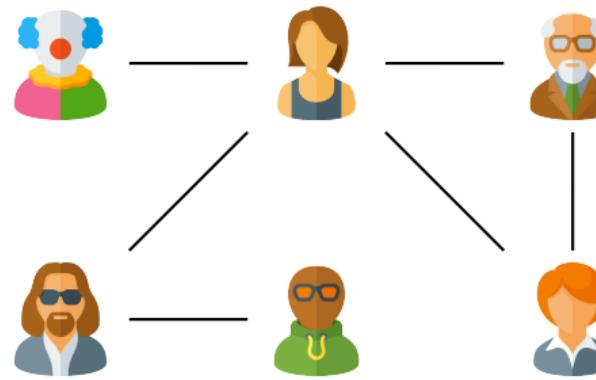

## Solving the Coalition Structure Generation (CSG) Problem

Compute the partition  $\mathcal{S}$  of  $A$  into *feasible* coalitions that *maximizes* the sum  $\sum_{S \in \mathcal{S}} v(S)$

## Graph-Restricted Coalition Structure Generation (CSG)

[RAHWAN et al., 2015]

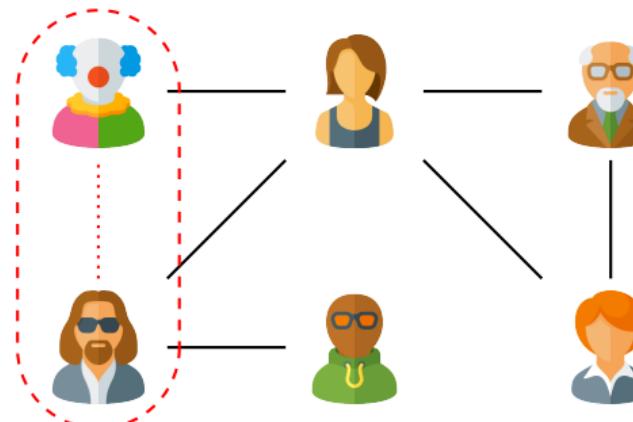

### Solving the Coalition Structure Generation (CSG) Problem

Compute the partition  $\mathcal{S}$  of  $A$  into *feasible* coalitions that *maximizes* the sum  $\sum_{S \in \mathcal{S}} v(S)$

# Graph-Restricted Coalition Structure Generation (CSG)

[RAHWAN et al., 2015]

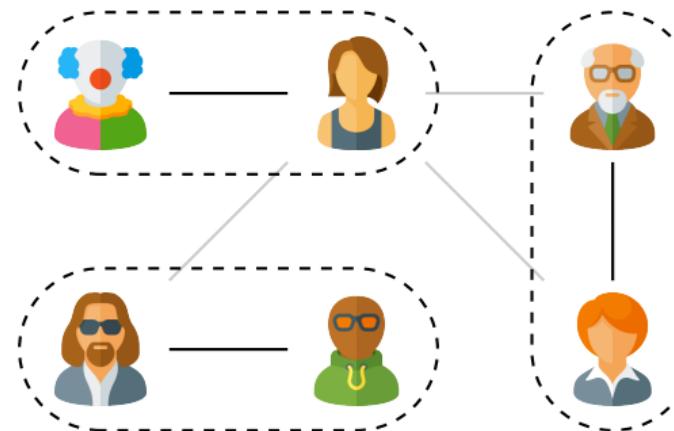

## Solving the Coalition Structure Generation (CSG) Problem

Compute the partition  $\mathcal{S}$  of  $A$  into *feasible* coalitions that *maximizes* the sum  $\sum_{S \in \mathcal{S}} v(S)$

## Graph-Restricted Coalition Structure Generation (CSG)

[RAHWAN et al., 2015]

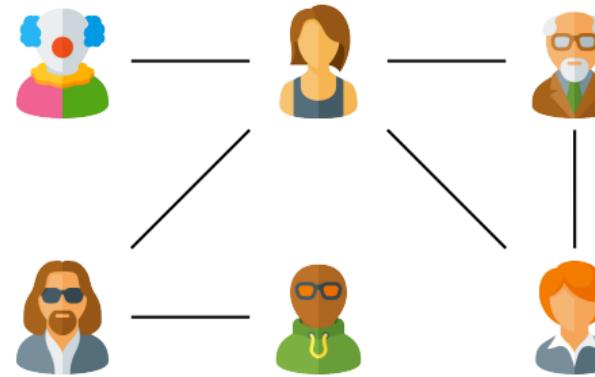

### Solving the Coalition Structure Generation (CSG) Problem

Compute the partition  $\mathcal{S}$  of  $A$  into *feasible* coalitions that *maximizes* the sum  $\sum_{S \in \mathcal{S}} v(S)$

## CSG Approaches based on Search

### CFSS Algorithm

- Builds a *Binary Decision Diagram* (BDD) by **contracting** (or **not**) an edge at each step
- Each coalition structure (i.e., partition of  $A$ ) is represented *only once* in the BDD
- The optimal coalition structure is computed by doing a *depth-first* traversal of the BDD

### Pros

Approximate algorithm with quality guarantees if used in conjunction with *Branch-and-Bound*

### Cons

Performance depends on the assumption that  $v(\cdot)$  can be expressed in *closed-form*

## CSG Approaches based on Search

# CSG Approaches based on Integer Linear Programming

## Background on Integer Linear Programming

### Weighted Knapsack Problem

We want to fill our knapsack (capacity =  $c$ ) with the goal of maximizing the total value

What is the Optimal Subset of Object for  $c = 5$ ?

- A** Pick  (weight = 1)  $\rightarrow 1$
- B** Pick  (weight = 2)  $\rightarrow 4$
- C** Pick  (weight = 4)  $\rightarrow 3$
- D** Pick  (weight = 5)  $\rightarrow 9$
- E** Pick  (weight = 3)  $\rightarrow 6$

- $w(\text{apple}) = 1, v(\text{apple}) = 1$
- $w(\text{diamond}) = 2, v(\text{diamond}) = 4$
- $w(\text{ring}) = 4, v(\text{ring}) = 3$
- $w(\text{crown}) = 6, v(\text{crown}) = 1$
- $w(\text{laptop}) = 3, v(\text{laptop}) = 6$

# CSG Approaches based on Integer Linear Programming

## Background on Integer Linear Programming

### Our Ingredients

- Let  $x_A, x_B, x_C, x_D, x_E$  be binary decision variables (either pick the object or not)
- Objective function: maximize the value of selected objects
- Constraint: do not exceed the knapsack capacity

### Integer Linear Programming (ILP) Formulation

maximize  $1 \cdot x_A + 4 \cdot x_B + 3 \cdot x_C + 9 \cdot x_D + 6 \cdot x_E$  (Values of selected objects)

subject to  $1 \cdot x_A + 2 \cdot x_B + 4 \cdot x_C + 5 \cdot x_D + 3 \cdot x_E \leq 5$  (Capacity constraint)

$x_A, x_B, x_C, x_D, x_E \in \{0, 1\}$  (Binary decision variables)

# CSG Approaches based on Integer Linear Programming

[RAHWAN et al., 2015]

- Given  $A$  and a set  $\mathcal{S}$  of *coalitions* (i.e., subsets) of  $A$ , let  $M$  be a  $|A| \times |\mathcal{S}|$  matrix
- $M_{iS} = 1$  if and only if agent  $a \in A$  is part of coalition  $S \in \mathcal{S}$ ,  $M_{iS} = 0$  otherwise

The diagram illustrates a set of agents and their possible coalitions. On the left, seven agents are shown, each with a unique combination of a face and a color (brown, blue, green, yellow, orange, pink, purple). Above the agents, seven coalitions are represented by brackets grouping different sets of agents. To the right of the matrix, three additional agents are shown, each with a different combination of a face and a color (brown, blue, green).

$$M = \begin{bmatrix} 1 & 0 & 0 & 1 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 1 \\ 0 & 0 & 1 & 0 & 1 & 1 & 1 \end{bmatrix} \begin{matrix} \text{brown face, blue} \\ \text{blue face, green} \\ \text{green face, yellow} \end{matrix}$$

## CSG Approaches based on Integer Linear Programming

[RAHWAN et al., 2015]

### Objective of Coalition Structure Generation

Compute the *partition* of  $A$  that *maximizes* the sum of the corresponding values

### ILP Formulation for Coalition Structure Generation

$$\text{maximize} \quad \sum_{S \in \mathcal{S}} v(S) \cdot x_S \quad \text{(Value of each selected coalition)}$$

$$\text{subject to} \quad \sum_{S \in \mathcal{S}} M_{iS} \cdot x_S = 1 \quad \forall i \in N \quad \text{(Each agent in *one* coalition)}$$

# CSG Approaches based on Integer Linear Programming

[RAHWAN et al., 2015]

## Solving Integer Linear Programs

ILPs can be solved with state-of-the-art solvers like CPLEX (very mature technology)

### Pros

Does not require any assumption on  $v(\cdot)$  (very general approach)

### Cons

- Memory requirements can become unmanageable for more than 20–30 agents
- Difficult to directly exploit the structure of the problem (i.e., graph)

# CSG as a COP

[BISTAFFA and FARINELLI, 2018]

## Challenge

How can we exploit the structure (i.e., hierarchy among agents)?

## Main Idea

- Each coalition (i.e., decision variable) is “controlled” by the highest agent
- “Delegate” the formation of coalitions to descendants by means of *required* variables

# CSG as a COP

## SECP model

## *Smart Environment Configuration Problem* [RUST et al., 2016]

- Example of applying DCOPs to a "real" problem
  - Coordinate objects in the building
  - Model
    - ▶ objects
    - ▶ relations between objects and environment
    - ▶ user objectives and requirements
  - Formulate the problem as an optimization problem

## SECP model

*Smart Environment Configuration Problem* [RUST et al., 2016]

Focus on smart lighting use cases

- **Objects:** anything that can produce light: light bulbs, windows with rolling shutter, etc.
- **User preferences:** having a predefined luminosity level in a room, under some conditions
- **Energy efficiency**

Linking objects and user preferences:

- How to model the luminosity in a room ? **variable**
- How to model the dependency between the light sources and the luminosity ? **function / constraint**

# SECP model

Example application to ambient intelligence scenario

## ■ Actuators

- ▶ Connected light bulbs, TV, Rolling shutters, ...

## ■ Sensors

- ▶ Presence detector, Luminosity Sensor, etc.

## ■ Physical Dependency Models

- ▶ E.g. Living-room light model

## ■ User Preferences

- ▶ Expressed as rules :

IF	presence_living_room	=	1
AND	light_sensor_living_room	<	60
THEN	light_level_living_room	←	60
AND	shutter_living_room	←	0

# SECP model

Example application to ambient intelligence scenario

## ■ Actuators

- ▶ Decision variable  $x_i$ , domain  $\mathcal{D}_{x_i}$
- ▶ Cost function  $c_i : \mathcal{D}_{x_i} \rightarrow \mathbb{R}$

## ■ Sensors

- ▶ Read-only variable  $s_l$ , domain  $\mathcal{D}_{s_l}$

## ■ Physical Dependency Models $\langle y_j, \phi_j \rangle$

- ▶ Give the expected state of the environment from a set of actuator-variables influencing this model
- ▶ Variable  $y_j$  representing the *expected* state of the environment
- ▶ Function  $\phi_j : \prod_{\varsigma \in \sigma(\phi_j)} \mathcal{D}_\varsigma \rightarrow \mathcal{D}_{y_j}$

## ■ User Preferences

- ▶ Utility function  $u_k$
- ▶ Distance from the current expected state to the target state of the environment

# Formulating SECP as a DCOP

## Multi-objective optimization problem

$$\begin{aligned}
 & \min_{x_i \in \nu(\mathfrak{A})} \sum_{i \in \mathfrak{A}} c_i \quad \text{and} \quad \max_{\substack{x_i \in \nu(\mathfrak{A}) \\ y_j \in \nu(\Phi)}} \sum_{k \in \mathfrak{R}} u_k \\
 & \text{s.t. } \phi_j(x_j^1, \dots, x_j^{\overline{\phi_j}}) = y_j \quad \forall y_j \in \nu(\Phi)
 \end{aligned}$$

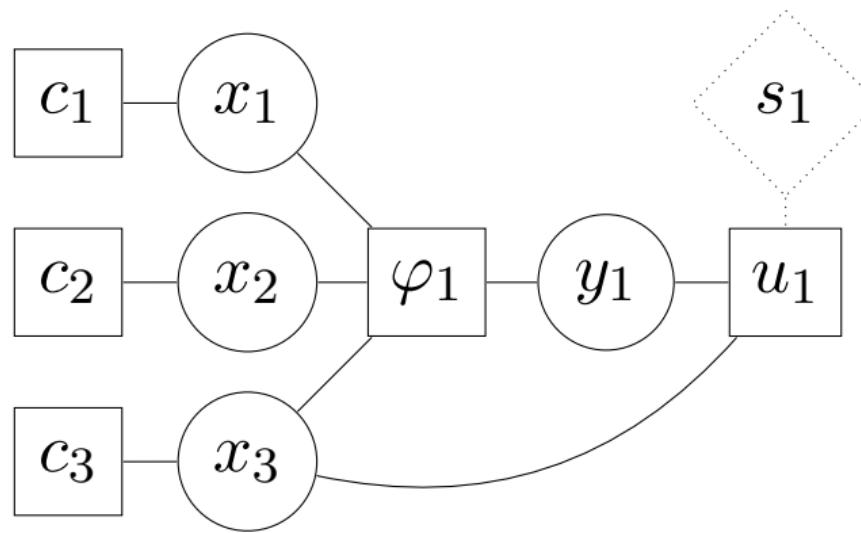

## Mono-objective DCOP formulation

$$\max_{\substack{x_i \in \nu(\mathfrak{A}) \\ y_j \in \nu(\Phi)}} \omega_u \sum_{k \in \mathfrak{R}} u_k - \omega_c \sum_{i \in \mathfrak{A}} c_i + \sum_{\varphi_j \in \Phi} \varphi_j$$

$$\varphi_j(x_j^1, \dots, x_j^{|\sigma(\phi_j)|}, y_j) = \begin{cases} 0 & \text{if } \phi_j(x_j^1, \dots, x_j^{|\sigma(\phi_j)|}) = y_j \\ -\infty & \text{otherwise} \end{cases}$$

# Observation Scheduling in Multi-Owner Constellations [PICARD, 2022]

- Increasing size of deployed EOS constellations
- ⇒ Observe any point on Earth at higher frequency, e.g. Planet constellation
- **but**, requires to **improve coordination and cooperation** between assets and stakeholders
- We focus here on **collective observation scheduling** on a constellation where some users have **exclusive access** to **some orbit portions**
- ⇒ Answer to strong user expectations to benefit both from a shared system (to reduce costs) and a proprietary system (total control and confidentiality)

## Observation Scheduling in Multi-Owner Constellations [PICARD, 2022]

## Illustrative Example

## DCOP Model

A DCOP  $\langle \mathcal{A}, \mathcal{X}, \mathcal{D}, \mathcal{C}, \mu \rangle$  is defined for a given request  $r$ , and a current scheduling

- The agents are the exclusive users which can potentially schedule  $r$ :

$$\mathcal{A} = \{u \in \mathcal{U}^{\text{ex}} \mid \exists (s, (t_u^{\text{start}}, t_u^{\text{end}})) \in e_u, \exists o \in \theta_r \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\} \quad (1)$$

- Each agent  $u$  owns binary decision variables, one for each observation  $o \in \mathcal{O}[u]^r$  and exclusive  $e$  in its exclusives  $e_u$ , stating whether it schedules  $o$  in  $e$  or not:

$$\mathcal{X} = \{x_{e,o} \mid e \in \bigcup_{u \in \mathcal{A}} e_u, o \in \mathcal{O}[u]^r\} \quad (2)$$

$$\mathcal{D} = \{\mathcal{D}_{x_{e,o}} = \{0, 1\} \mid x_{e,o} \in \mathcal{X}\} \quad (3)$$

with  $\mathcal{O}[u]^r = \{o \in \theta_r \mid \exists (s, (t_o^{\text{start}}, t_o^{\text{end}})) \in e_u, \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\}$  are observations related to request  $r$  that can be scheduled on  $u$ 's exclusives

- $\mu$  associates each variable  $x_{e,o}$  to  $e$ 's owner

## DCOP Model

A DCOP  $\langle \mathcal{A}, \mathcal{X}, \mathcal{D}, \mathcal{C}, \mu \rangle$  is defined for a given request  $r$ , and a current scheduling

- The agents are the exclusive users which can potentially schedule  $r$ :

$$\mathcal{A} = \{u \in \mathcal{U}^{\text{ex}} \mid \exists (s, (t_u^{\text{start}}, t_u^{\text{end}})) \in e_u, \exists o \in \theta_r \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\} \quad (1)$$

- Each agent  $u$  owns binary decision variables, one for each observation  $o \in \mathcal{O}[u]^r$  and exclusive  $e$  in its exclusives  $e_u$ , stating whether it schedules  $o$  in  $e$  or not:

$$\mathcal{X} = \{x_{e,o} \mid e \in \bigcup_{u \in \mathcal{A}} e_u, o \in \mathcal{O}[u]^r\} \quad (2)$$

$$\mathcal{D} = \{\mathcal{D}_{x_{e,o}} = \{0, 1\} \mid x_{e,o} \in \mathcal{X}\} \quad (3)$$

with  $\mathcal{O}[u]^r = \{o \in \theta_r \mid \exists (s, (t_o^{\text{start}}, t_o^{\text{end}})) \in e_u, \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\}$  are observations related to request  $r$  that can be scheduled on  $u$ 's exclusives

- $\mu$  associates each variable  $x_{e,o}$  to  $e$ 's owner

## DCOP Model

- The agents are the exclusive users which can potentially schedule  $r$ :

$$\mathcal{A} = \{u \in \mathcal{U}^{\text{ex}} \mid \exists (s, (t_u^{\text{start}}, t_u^{\text{end}})) \in e_u, \exists o \in \theta_r \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\} \quad (1)$$

- Each agent  $u$  owns binary decision variables, one for each observation  $o \in \mathcal{O}[u]^r$  and exclusive  $e$  in its exclusives  $e_u$ , stating whether it schedules  $o$  in  $e$  or not:

$$\mathcal{X} = \{x_{e,o} \mid e \in \bigcup_{u \in \mathcal{A}} e_u, o \in \mathcal{O}[u]^r\} \quad (2)$$

$$\mathcal{D} = \{\mathcal{D}_{x_{e,o}} = \{0, 1\} \mid x_{e,o} \in \mathcal{X}\} \quad (3)$$

with  $\mathcal{O}[u]^r = \{o \in \theta_r \mid \exists (s, (t_u^{\text{start}}, t_u^{\text{end}})) \in e_u, \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\}$  are observations related to request  $r$  that can be scheduled on  $u$ 's exclusives

- $\mu$  associates each variable  $x_{e,o}$  to  $e$ 's owner

## DCOP Model

A DCOP  $\langle \mathcal{A}, \mathcal{X}, \mathcal{D}, \mathcal{C}, \mu \rangle$  is defined for a given request  $r$ , and a current scheduling

- The agents are the exclusive users which can potentially schedule  $r$ :

$$\mathcal{A} = \{u \in \mathcal{U}^{\text{ex}} \mid \exists (s, (t_u^{\text{start}}, t_u^{\text{end}})) \in e_u, \exists o \in \theta_r \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\} \quad (1)$$

- Each agent  $u$  owns binary decision variables, one for each observation  $o \in \mathcal{O}[u]^r$  and exclusive  $e$  in its exclusives  $e_u$ , stating whether it schedules  $o$  in  $e$  or not:

$$\mathcal{X} = \{x_{e,o} \mid e \in \bigcup_{u \in \mathcal{A}} e_u, o \in \mathcal{O}[u]^r\} \quad (2)$$

$$\mathcal{D} = \{\mathcal{D}_{x_{e,o}} = \{0, 1\} \mid x_{e,o} \in \mathcal{X}\} \quad (3)$$

with  $\mathcal{O}[u]^r = \{o \in \theta_r \mid \exists (s, (t_u^{\text{start}}, t_u^{\text{end}})) \in e_u, \text{ s.t. } s_o = s, [t_u^{\text{start}}, t_u^{\text{end}}] \cap [t_o^{\text{start}}, t_o^{\text{end}}] \neq \emptyset\}$  are observations related to request  $r$  that can be scheduled on  $u$ 's exclusives

- $\mu$  associates each variable  $x_{e,o}$  to  $e$ 's owner

## DCOP Model (cont.)

- Constraints should check that at most one observation is scheduled per request (4), that satellites are not overloaded (5), that at most one agent serves the same observation (6)

$$\sum_{e \in \bigcup_{u \in \mathcal{A}} e_u} x_{e,o} \leq 1, \quad \forall u \in \mathcal{X}, \forall o \in \mathcal{O}[u]^r \quad (4)$$

$$\sum_{o \in \{o \in \mathcal{O}[u]^r \mid u \in \mathcal{A}, s_o = s\}, e \in \bigcup_{u \in \mathcal{A}} e_u} x_{e,o} \leq \kappa_s^*, \quad \forall s \in \mathcal{S} \quad (5)$$

$$\sum_{e \in \bigcup_{u \in \mathcal{A}} e_u} x_{e,o} \leq 1, \quad \forall o \in \mathcal{O} \quad (6)$$

- The cost to integrate an observation in the current user's schedule should be assessed to guide the optimization process

$$c(x_{e,o}) = \pi(o, \mathcal{M}_{u_o}), \quad \forall x_{e,o} \in \mathcal{X} \quad (7)$$

where  $\pi$  evaluates the best cost obtained when scheduling  $o$  and any combination of observations from  $\mathcal{M}_{u_o}$ , as to consider all possible revisions of  $u_o$ 's current schedule

$$\mathcal{C} = \{(4), (5), (6), (7)\} \quad (8)$$

## DCOP Model (cont.)

Conclusion and Wrap-up

# Shared Mobility as (Online) Coalition Structure Generation

[BISTAFFA et al., 2019]

## What is Shared Mobility for Us?

Arrange *shared rides* (coalitions) among users that submit *real-time* requests, with the objective of *maximizing* a given *objective function*

# Shared Mobility as (Online) Coalition Structure Generation

[ibid.]

## Our Task

*At each time step, arrange a (possibly empty) set of non-overlapping feasible cars among the requests currently active in the system*

## Our Objective Function

Maximize environmental benefits  and quality of service 

## Our Case Study [BISTAFFA et al., 2019]

Densely populated areas (e.g., Manhattan) with request rate of 400 reqs/minute

# Shared Mobility as (Online) Coalition Structure Generation

[ibid.]

## Our Task

*At each time step, arrange a (possibly empty) set of non-overlapping feasible cars among the requests currently active in the system*

## Our Objective Function

Maximize environmental benefits  and quality of service 

## Our Case Study [BISTAFFA et al., 2019]

Densely populated areas (e.g., Manhattan) with request rate of 400 reqs/minute

## Our Objective Function

Maximize environmental benefits  and quality of service 

## Our Case Study [BISTAFFA et al., 2019]

Densely populated areas (e.g., Manhattan) with request rate of 400 reqs/minute

## Input of the Online CSG Problem

[BISTAFFA et al., 2019]

## Incoming Requests

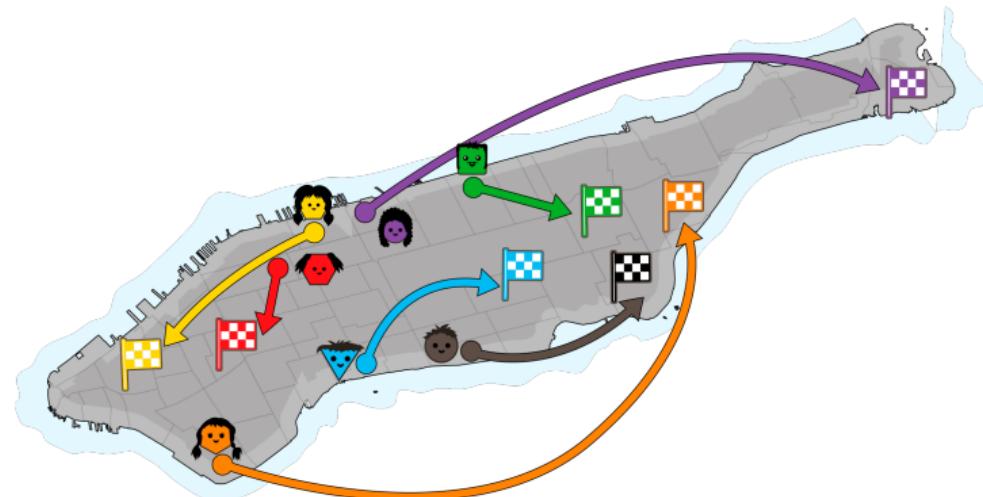

"I just issued a trip request"

## Waiting Trip Requests

“I am waiting to share my ride”

# Input of the Online CSG Problem

[BISTAFFA et al., 2019]

## Example of a Shared Mobility Request

“I want to go from point  $i$  to point  $j$ , and I am willing to wait  $\delta$  minutes to be picked up by somebody ( $d = \text{false}$ ) / before I leave with *my own car* ( $d = \text{true}$ )”

- $r = \langle i, j, d, \delta \rangle$  (A request is a tuple  $r$ )
- $r \in R_t$  (The system receives a set  $R_t$  of requests at each time step  $t$ )
- $\langle R_1, \dots, R_t, \dots, R_h \rangle$  (Sequence of inputs over a time horizon  $h$ )
- The input sequence is *not known a priori* (Online optimization problem)

# Input of the Online CSG Problem

[BISTAFFA et al., 2019]

# Value $v(S)$ of a Coalition $S$

[BISTAFFA et al., 2019]

- The *value* (utility) of a coalition  $S$  is defined as:

$$v(S) = \overbrace{\rho_{\text{CO}_2} \cdot E_{\text{CO}_2}(S) + \rho_{\text{noise}} \cdot E_{\text{noise}}(S) + \rho_{\text{traffic}} \cdot E_{\text{traffic}}(S)}^{\text{environmental benefits}} + \overbrace{\rho_{\text{QoS}} \cdot Q(S)}^{\text{quality of service}}$$

- $|S| \leq k$  (Maximum cardinality constraint)

$$F(S) = |S| \leq k \wedge \dots$$

- $\mathcal{F}(R) = \{S \in 2^R \mid F(S)\}$  (Set of feasible coalitions from a set  $R$  of requests)

# Value $v(S)$ of a Coalition $S$

[BISTAFFA et al., 2019]

- The *value* (utility) of a coalition  $S$  is defined as:

$$v(S) = \overbrace{\rho_{\text{CO}_2} \cdot E_{\text{CO}_2}(S) + \rho_{\text{noise}} \cdot E_{\text{noise}}(S) + \rho_{\text{traffic}} \cdot E_{\text{traffic}}(S)}^{\text{environmental benefits}} + \overbrace{\rho_{\text{QoS}} \cdot Q(S)}^{\text{quality of service}}$$

- $|S| \leq k$  (Maximum cardinality constraint)

$$F(S) = |S| \leq k \wedge \dots$$

- $\mathcal{F}(R) = \{S \in 2^R \mid F(S)\}$  (Set of feasible coalitions from a set  $R$  of requests)

# Value $v(S)$ of a Coalition $S$

[BISTAFFA et al., 2019]

- The *value* (utility) of a coalition  $S$  is defined as:

$$v(S) = \overbrace{\rho_{\text{CO}_2} \cdot E_{\text{CO}_2}(S) + \rho_{\text{noise}} \cdot E_{\text{noise}}(S) + \rho_{\text{traffic}} \cdot E_{\text{traffic}}(S)}^{\text{environmental benefits}} + \overbrace{\rho_{\text{QoS}} \cdot Q(S)}^{\text{quality of service}}$$

- $|S| \leq k$  (Maximum cardinality constraint)

$$F(S) = |S| \leq k \wedge \dots$$

- $\mathcal{F}(R) = \{S \in 2^R \mid F(S)\}$  (Set of feasible coalitions from a set  $R$  of requests)

# Curse of Dimensionality

[BISTAFFA et al., 2019]

- Recall that  $\mathcal{F}(R) = \{S \in 2^R \mid F(S)\}$
- With  $|S| \leq k$ ,  $|\mathcal{F}(R)| \leq \sum_{i=1}^k \binom{|R|}{i}$ , i.e.,  $\mathcal{O}(|R|^k)$  (Polynomial complexity)
- In practice,  $|R_t|$  can be as high as 400 (Request rate in NY taxi dataset)

## Scalability Problem

Enumerating all coalitions in  $\mathcal{F}(R)$  is impractical, especially in realistic application scenarios with *very limited time budget* for the solution

## Our Solution

Consider a restricted set  $\hat{\mathcal{F}}(R)$  of *good candidate coalitions* instead of  $\mathcal{F}(R)$

# Curse of Dimensionality

[BISTAFFA et al., 2019]

- Recall that  $\mathcal{F}(R) = \{S \in 2^R \mid F(S)\}$
- With  $|S| \leq k$ ,  $|\mathcal{F}(R)| \leq \sum_{i=1}^k \binom{|R|}{i}$ , i.e.,  $\mathcal{O}(|R|^k)$  (Polynomial complexity)

Conclusion and Wrap-up

# Collective Energy Purchasing

[FARINELLI et al., 2013]

## Collective Energy Purchasing Scenario

- Each agent has an energy consumption profile
- Customers form coalitions to buy energy at reduced tariffs from two different markets:
  - ▶ *Spot market*: a short-term market intended for smaller amounts of energy
  - ▶ *Forward market*: a long-term market to buy more energy at cheaper prices

# Collective Energy Purchasing

[FARINELLI et al., 2013]

## Collective Energy Purchasing Scenario

- Each agent has an energy consumption profile
- Customers form coalitions to buy energy at reduced tariffs from two different markets:
  - ▶ *Spot market*: a short-term market intended for smaller amounts of energy
  - ▶ *Forward market*: a long-term market to buy more energy at cheaper prices

# Collective Energy Purchasing

[FARINELLI et al., 2013]

  - ▶ *Forward market*: a long-term market to buy more energy at cheaper prices

# Collective Energy Purchasing

[FARINELLI et al., 2013]

## Profile Merging

- Peaks in energy profiles require the use of *expensive, carbon-intensive*, peaking plant generators, resulting in higher consumers electricity bill
- A *flattened* profile results in a more efficient grid, with *lower carbon emissions* and *lower prices* for consumers

## Example

# Value $v(S)$ of a Coalition $S$

[BISTAFFA et al., 2017a]

- The *value* (utility) of a coalition  $S$  is defined as:

$$v(S) = \underbrace{\sum_{t=1}^T q_S^t(S) \cdot p_S}_{\text{Spot market}} + \underbrace{T \cdot q_F(S) \cdot p_F}_{\text{Forward market}} - \underbrace{\kappa(S)}_{\text{Coordination cost}}$$

Purchased energy cost

Coordination cost

Spot market

Forward market

- $q_S^t(S)$ : energy purchased from spot market at time  $t$
- $q_F(S)$ : total energy purchased from forward market
- $p_S$ : spot market energy price
- $p_F$ : forward market energy price

# Value $v(S)$ of a Coalition $S$

[BISTAFFA et al., 2017a]

- The *value* (utility) of a coalition  $S$  is defined as:

$$v(S) = \underbrace{\sum_{t=1}^T q_S^t(S) \cdot p_S}_{\text{Spot market}} + \underbrace{T \cdot q_F(S) \cdot p_F}_{\text{Forward market}} - \kappa(S)$$

Superadditive ( $v^+(S)$ )      Subadditive ( $v^-(S)$ )

- $q_S^t(S)$ : energy purchased from spot market at time  $t$
- $q_F(S)$ : total energy purchased from forward market
- $p_S$ : spot market energy price
- $p_F$ : forward market energy price

# $m + a$ Characteristic Functions

[BISTAFFA et al., 2017a]

## $m + a$ Characteristic Function

- $m + a =$  Superadditive function + subadditive function
  - ▶ Superadditive:  $v(S_1 \cup S_2) > v(S_1) + v(S_2)$
  - ▶ Subadditive:  $v(S_1 \cup S_2) < v(S_1) + v(S_2)$

## Question

Is the characteristic function of shared mobility  $m + a$ ?

# $m + a$ Characteristic Functions

[BISTAFFA et al., 2017a]

## $m + a$ Characteristic Function

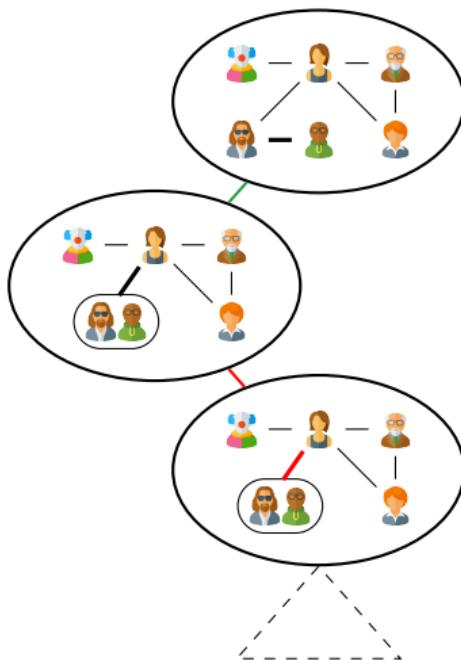

- $m + a =$  Superadditive function + subadditive function

**pyDCOP: a python Library for DCOPs**

Conclusion and Wrap-up

# Programming and Evaluating DCOP Algorithms

Several libraries currently exist for the study of DCOP

- **AgentZero** is a Java-based library [LUTATI et al., 2014]
- **Frodo2** is actively developed<sup>1</sup> at École Polytechnique Fédérale de Lausanne (EPFL) [LÉAUTÉ et al., 2009]
- **DisChoco** is also Java-based and supports real distributed settings WAHBI et al., 2011, but discontinued since 2014
- **pyDCOP** is a python library developed by Orange Labs, focusing on Internet-of-Things and dynamic deployment of DCOPs [RUST et al., 2019]

# Hands on PyDCOP

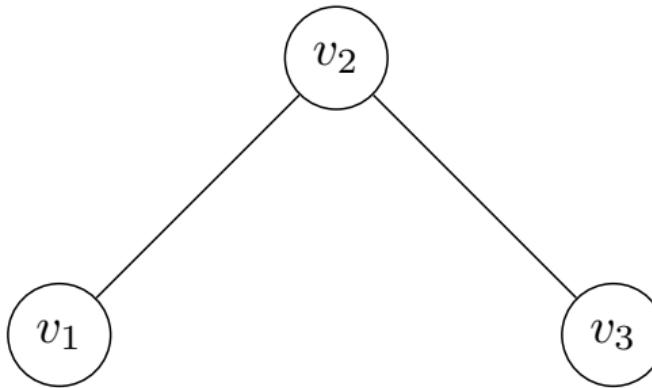

- Install VirtualBox
- Import the pyDCOP Virtual Machine (<http://bit.ly/pyDCOP>)
  - ▶ It's a Debian image with everything preinstalled:
  - ▶ python3, pyDCOP, matplotlib, glpk, etc.

- Alternatively, follow

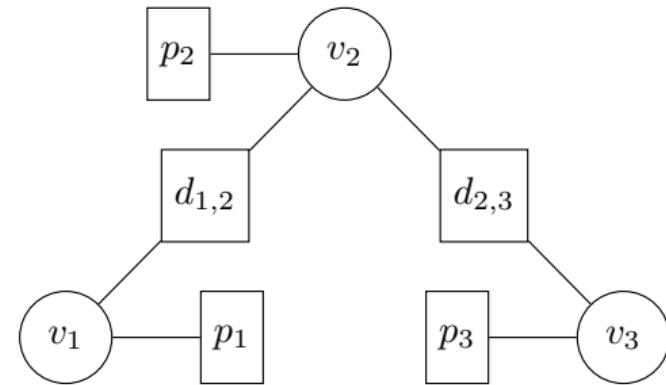

<https://pydcop.readthedocs.io/en/latest/installation.html>

1. [https://pydcop.readthedocs.io/en/latest/tutorials/getting\\_started.html](https://pydcop.readthedocs.io/en/latest/tutorials/getting_started.html)
2. [https://pydcop.readthedocs.io/en/latest/tutorials/analysing\\_results.html](https://pydcop.readthedocs.io/en/latest/tutorials/analysing_results.html)

## Graph Coloring

(a) constraints graph

(b) factor graph

- **Objective:** minimize
- **Domain:** 2 colors  $R$  and  $B$
- **Variables:**  $V_1, V_2, V_3$
- **Constraints:** neighbors must have different colors + preferences
- **Agents:** 3 agents

Yaml representation  
 Multi-Agent Distributed Constrained Optimization

## pyDCOP yaml format

### graph\_coloring.yaml

```
name: graph coloring
objective: min

domains:
  colors:
    values: [R, G]

variables:
  v1:
    domain: colors
  v2:
    domain: colors
  v3:
    domain: colors
```

```
constraints:
  pref_1:
    type: extensional
    variables: v1
    values:
      -0.1: R
      0.1: G
  pref_2:
    type: extensional
    variables: v2
    values:
      -0.1: G
      0.1: R
  pref_3:
    type: extensional
    variables: v3
    values:
      -0.1: G
      0.1: R
  diff_1_2:
    type: intention
    function: 10 if v1 == v2 else 0
  diff_2_3:
    type: intention
    function: 10 if v3 == v2 else 0

agents: [a1, a2, a3, a4, a5]
```

## Solving the Graph Coloring DCOP

**Command:**

```
$ pydcop solve --algo dpop graph_coloring.yaml
```

**Output:**

```
...
"assignment": {
    "v1": "R",
    "v2": "G",
    "v3": "R"
},
"cost": -0.1,
...
```

**With other algorithms:**

```
$ pydcop --timeout 2 solve --algo dsa graph_coloring.yaml
$ pydcop solve --algo mgm --algo_params stop_cycle:20 \
    graph_coloring.yaml
```

# Results

## Full results :

```
{  
  "agt_metrics": {  
    ...  
  },  
  "assignment": {  
    "v1": "R",  
    "v2": "G",  
    "v3": "R"  
  },  
  "cost": -0.1,  
  "cycle": 20,  
  "msg_count": 158,  
  "msg_size": 158,  
  "status": "FINISHED",  
  "time": 0.03201029699994251,  
  "violation": 0  
}
```

# Logs

## Simple:

use -v 0..3

```
$ pydcop -v 3 solve --algo dsa --algo_params stop_cycle:20 graph_coloring.yaml
```

## Precise :

use -log <log.conf>

```
$ pydcop --log log.conf solve --algo dsa --algo_params stop_cycle:10 graph_coloring.yaml
```

Now, look at algo.log

## Run-time metrics

**periodic:** "--collect\_on period --period <p>"

```
$ pydcop --log log.conf -t 10 solve \
  --collect_on period --period 1 --run_metric ./metrics.csv \
  --algo dsa graph_coloring.yaml
```

**cycle:** "--collect\_on cycle\_change"

Only supported with synchronous algorithms !

```
$ pydcop solve --algo mgm --algo_params stop_cycle:20 \
  --collect_on cycle_change --run_metric ./metrics.csv \
  graph_coloring_50.yaml
```

**value:** "--collect\_on value\_change"

```
$ pydcop -t 5 solve --algo mgm --collect_on value_change \
  --run_metric ./metrics_on_value.csv \
  graph_coloring_50.yaml
```

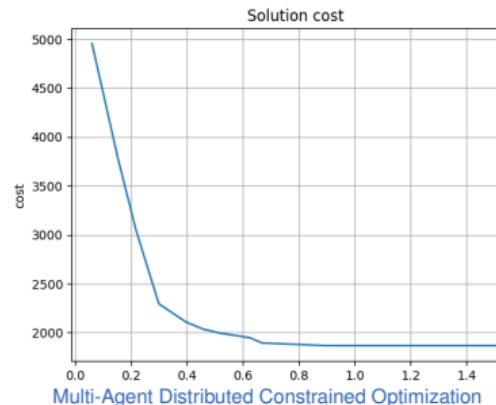

## Run-time metrics

With a bigger graph coloring problem

```
$ pydcop solve --algo mgm --algo_params stop_cycle:20 \
    --collect_on cycle_change \
    --run_metric ./metrics.csv \
    graph_coloring_50.yaml
```

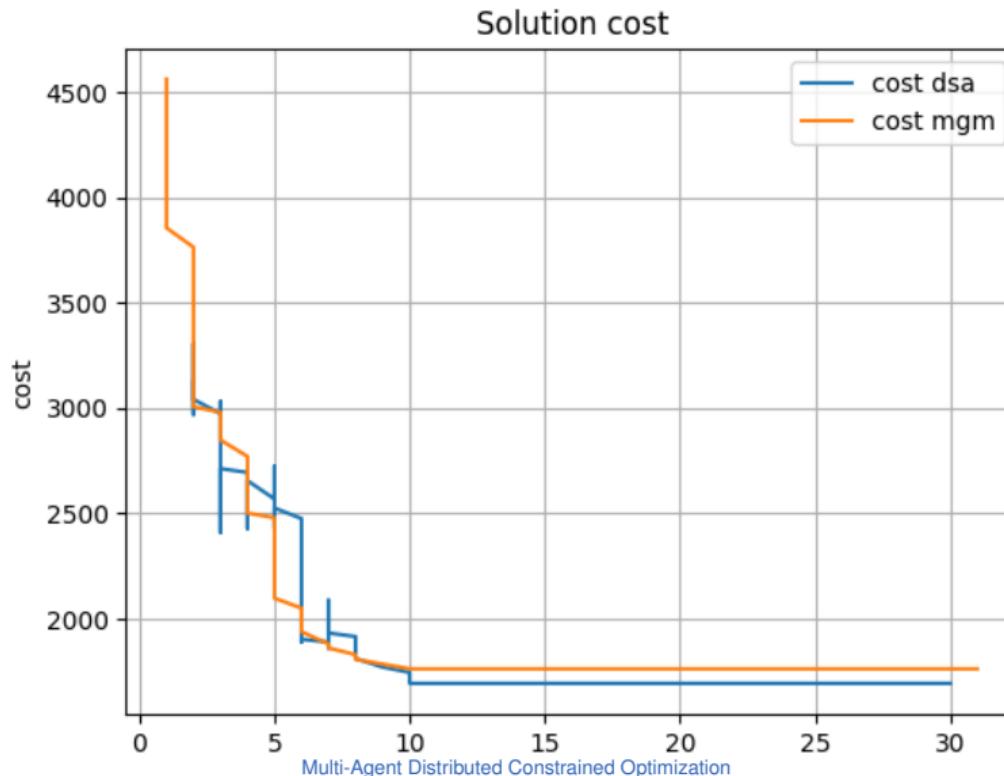

## Plotting with matplotlib

```
$ python3 plot_cost.py ./metrics.csv
```

## Run-time metrics

MGM (1720) and DSA (1647) , both with 30 cycles

# Today's Menu

Introduction and Motivations

Distributed Constraint Optimization

Coalition Formation on MAS

Real-World Applications

Conclusion and Wrap-up

# Conclusion and Wrap-up

## What We've Seen Today

- 2 major multi-agent constraint optimization frameworks: **DCOP, CF**
  - ▶ DCOP: how to **collectively solve** constraint optimization problems
  - ▶ CF: how to **form coalitions/groups** with respect to some criteria and constraints
- Various **techniques and algorithms** to attack these problems
- Examples of **applications** in the transportation, IoT, space and energy domain

# Conclusion and Wrap-up

## Open questions

### Distributed constraint optimization

- How to **decompose or regroup** as to reduce **interactions**?
- How to **structure** the system as to improve **parallelism**?
- How to deploy and make systems robust and resilient in **dynamic environments**?

### Coalition formation

- Which other **realistic** scenarios can we model as  $m + a$ ?
- Can we exploit some other **properties** for scenarios that are not  $m + a$  (e.g., shared mobility)?
- More in general, how can we **improve** the **scalability** of CF approaches?

### Common questions

- How to use DCOPs in CF and vice versa?
- Maintaining libraries and data sets

# Hands on PyDCOP I

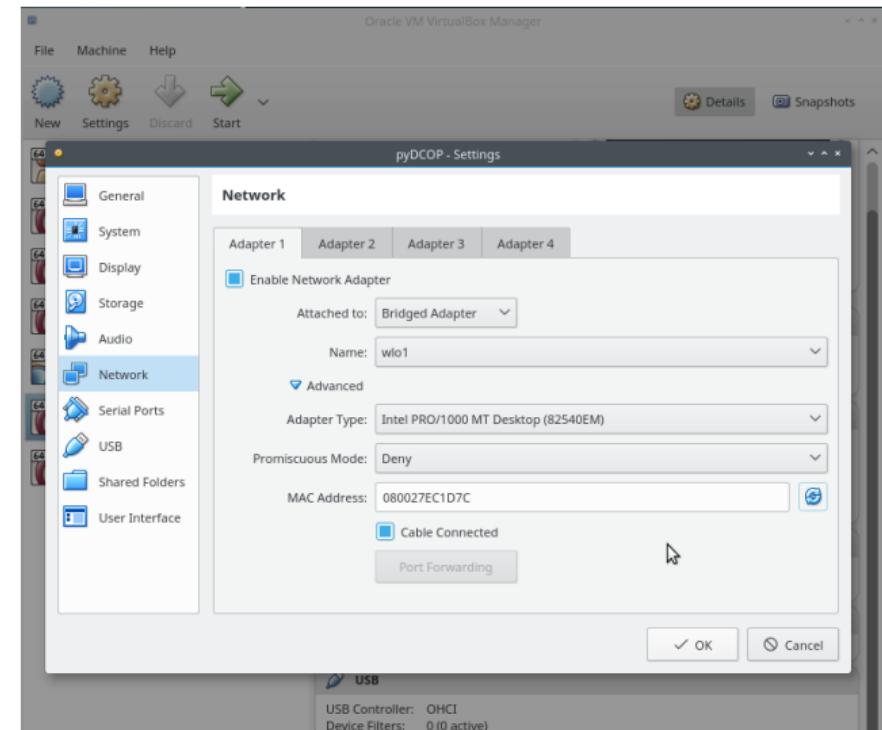

## Virtual machine Setup

Before starting the VM:

- "Bridged adapter" mode
- Select wifi network adapter
- Reset MAC Address

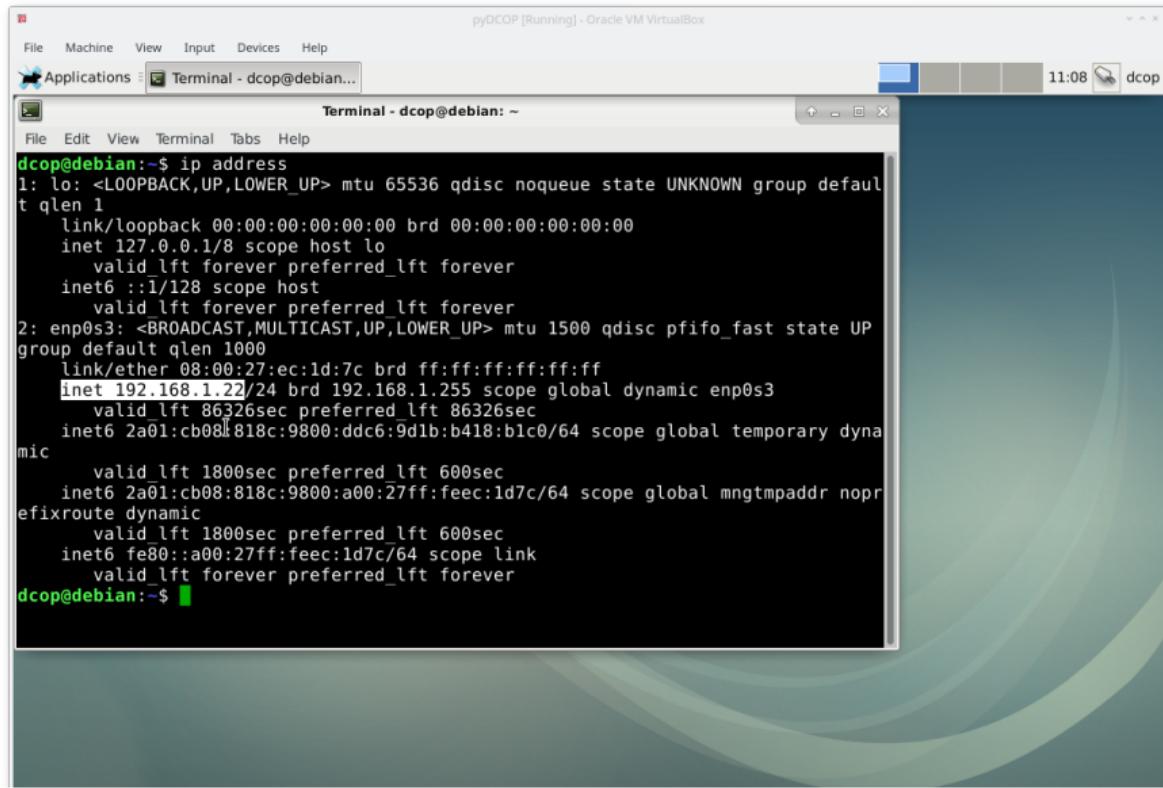

Then

- Start the VM
- login: dcop / pyDCOP
- Launch a terminal
- Note down the IP with ip address

# Hands on PyDCOP |

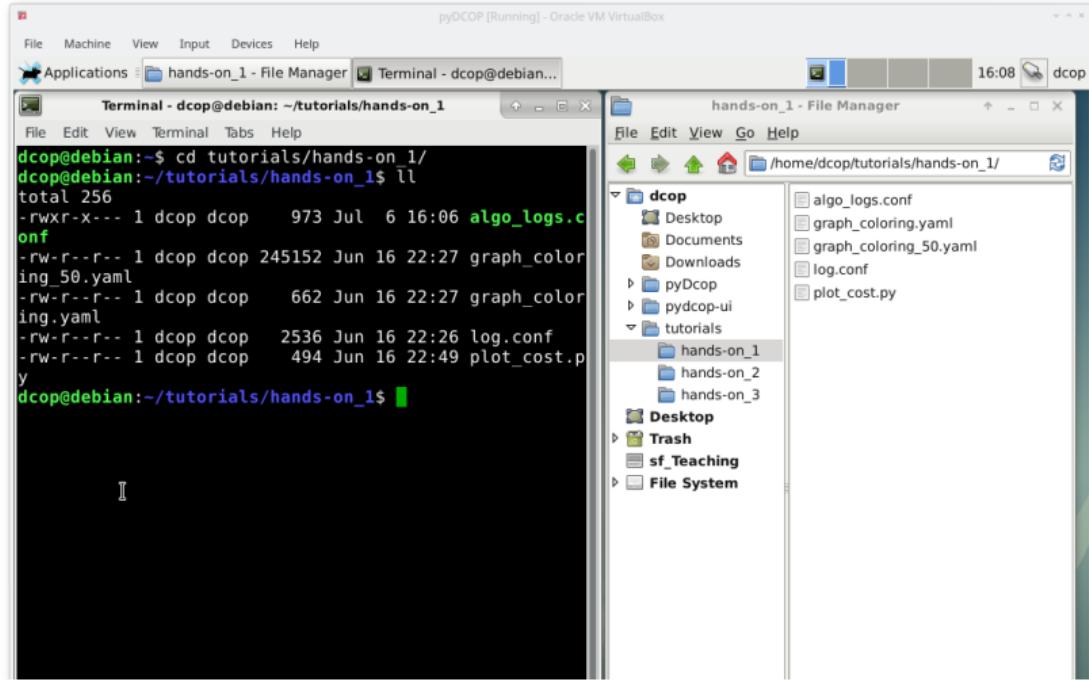

## Virtual machine Setup

# Hands on PyDCOP |

Files for the tutorials are in `/home/dcop/tutorials`.

```
$ cd /home/dcop/tutorials/hands-on_1
```

# Hands on PyDCOP I

## Web-ui

Web-base agent graphical interface:

- Run the web application

```
$ cd ~/pydcop-ui  
$ python3 -m http.server
```

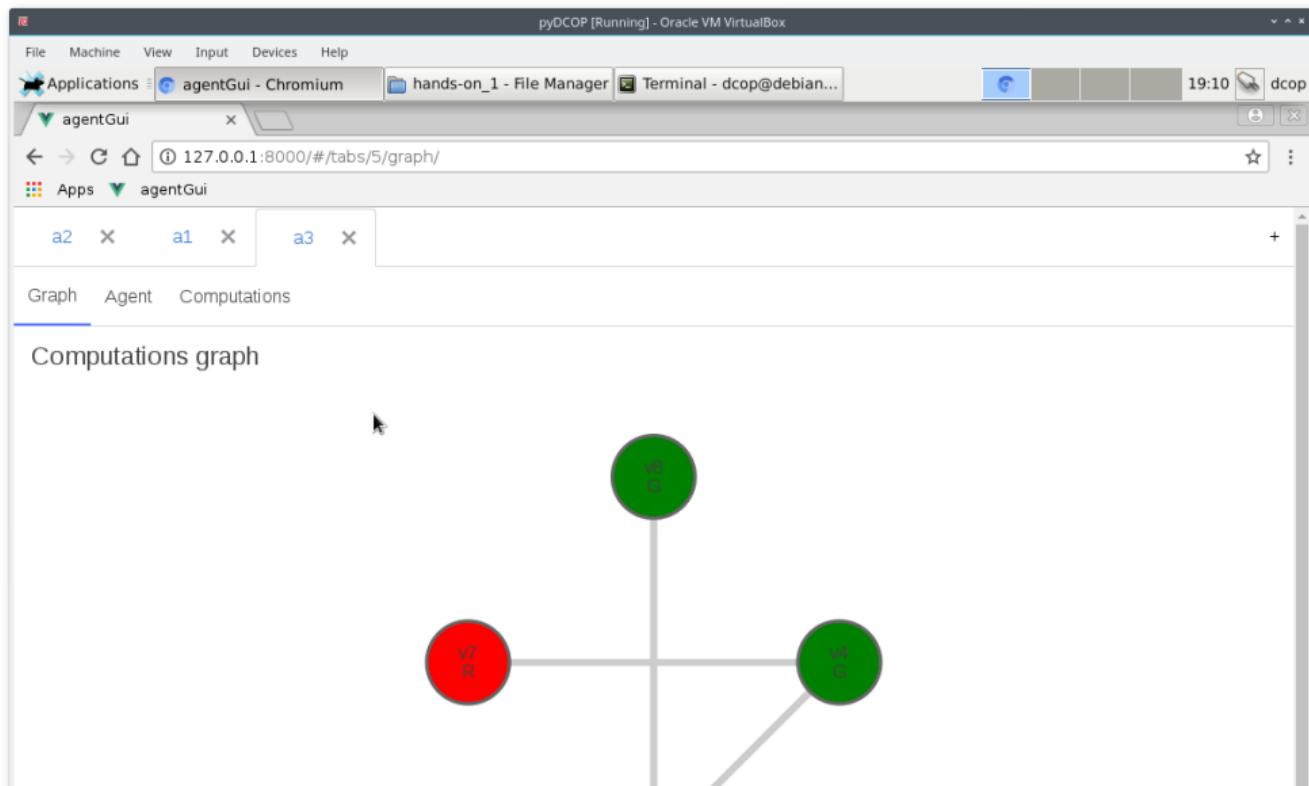

- Launch a browser on `http://127.0.0.1:8000`
- Solve the dcop with the option `--uiport <port>` (also, use `--delay <delay>`)

```
$ pydcop -v 3 solve -a mgm -d adhoc --delay 2 --uiport 10000  
./graph_coloring_3agts_10vars.yaml
```

- Each agent exposes a web-socket, the web application connects to these websockets and display the agents' state.

## Web-ui

The screenshot shows a web browser window titled "pyDCOP [Running] - Oracle VM VirtualBox" displaying the "agentGui" application. The browser's address bar shows the URL `127.0.0.1:8000/#/tabs/5/computations`. The interface has a navigation bar with tabs for "Graph", "Agent", and "Computations", with "Computations" being the active tab. Below the tabs is a table titled "Computations" with the following data:

Name	Algo	Type	Size	Value	Cycles	Messages
v8	dsa	variable	5	G	12	11 / 11
v4	dsa	variable	20	G	13	48 / 48
v3	dsa	variable	10	R	12	22 / 22
v7	dsa	variable	10	R	12	24 / 24
